Electrical Characteristics

NOTE

1 This is the IC supply current value during clock and signal input.

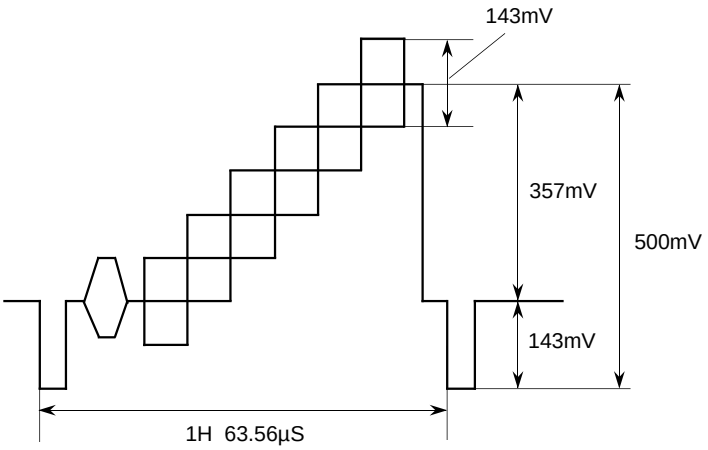
2 GL is the output gain of OUT pin when a 500 mVp-p, 200 kHz sine wave is fed to IN pin.

$$GL = 20 \log \frac{\text{OUT pin output voltage [mVp-p]}}{500 \text{ [mVp-p]}} \text{ [dB]}$$

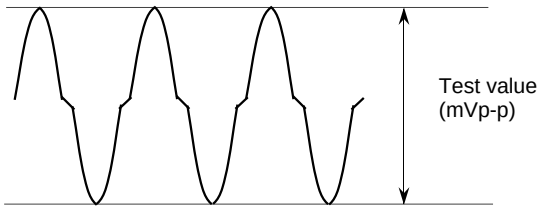
3 Indicates the dissipation at 3.58 MHz in relation to 200 kHz. From the output voltage at OUT pin when a 150 mVp-p, 200 kHz sine wave is fed to IN pin, and from the output voltage at OUT pin when a 150 mVp-p, 3.58 MHz sine wave is fed to the same, calculation is made according to the following formula.

$$fR = 20 \log \frac{\text{OUT pin output voltage (3.58 MHz) [mVp-p]}}{\text{OUT pin output voltage (200 kHz) [mVp-p]}} \text{ [dB]}$$

4 In Fig. below, the differential gain (DG) and the differential phase (DP) are tested with a vector scope when the 5-staircase wave is fed.



5 Leakage of internal clock components and related high frequency component to the output signal, during no signal input, is tested.



6 S/N ratio during a 50 % white video signal input shown in Fig. below is tested at the video noise meter, in BPF 100 kHz to 4 MHz, Sub Carrier Trap mode.
