

# PQ30RV31

Variable Output Low Power-Loss Voltage Regulator

## ■ Features

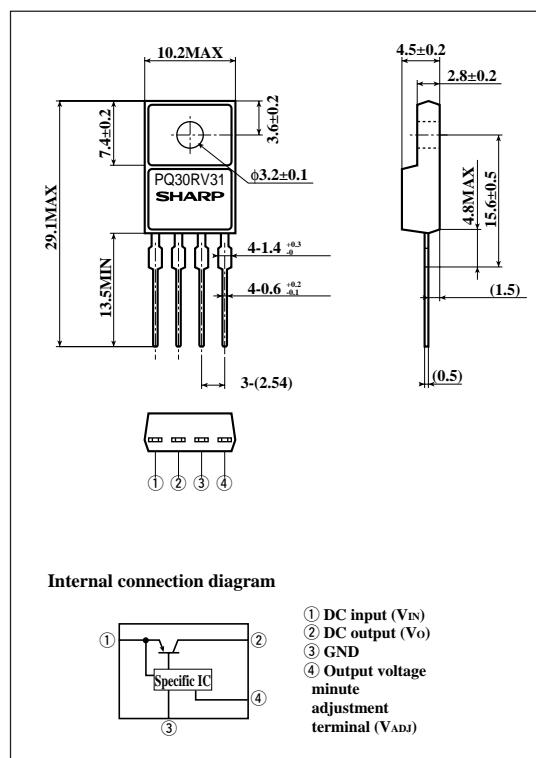

- Maximum output current : 3A
- Compact resin full-mold package.
- Low power-loss (Dropout voltage : MAX.0.5V)
- Variable output voltage (setting range : 1.5 to 30V)
- Built-in ON/OFF control function.

## ■ Applications

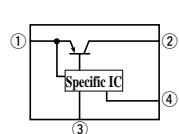

- Power supply for print concentration control of word processors
- Series power supply for motors and solenoid
- Series power supply for VCRs and TVs

## ■ Outline Dimensions

(Unit : mm)

Internal connection diagram

- ① DC input ( $V_{IN}$ )
- ② DC output ( $V_O$ )
- ③ GND
- ④ Output voltage minute adjustment terminal ( $V_{ADJ}$ )

## ■ Absolute Maximum Ratings

( $T_a=25^\circ\text{C}$ )

| Parameter                                   | Symbol    | Rating        | Unit |
|---|-----------|---------------|------|
| *1 Input voltage                            | $V_{IN}$  | 35            | V    |
| *1 Output adjustment terminal voltage       | $V_{ADJ}$ | 7             | V    |
| Output current                              | $I_O$     | 3             | A    |
| Power dissipation (No heat sink)            | $P_{D1}$  | 2.0           | W    |
| Power dissipation (With infinite heat sink) | $P_{D2}$  | 20            | W    |
| *2 Junction temperature                     | $T_j$     | 150           | °C   |
| Operating temperature                       | $T_{opr}$ | -20 to +80    | °C   |
| Storage temperature                         | $T_{stg}$ | -40 to +150   | °C   |
| Soldering temperature                       | $T_{sol}$ | 260 (For 10s) | °C   |

\*1 All are open except GND and applicable terminals.

\*2 Overheat protection function may operate at  $125 \leq T_j \leq 150^\circ\text{C}$ .

• Please refer to the chapter "Handling Precautions".

**SHARP**

"In the absence of confirmation by device specification sheets, SHARP takes no responsibility for any defects that may occur in equipment using any SHARP devices shown in catalogs, data books, etc. Contact SHARP in order to obtain the latest version of the device specification sheets before using any SHARP's device."

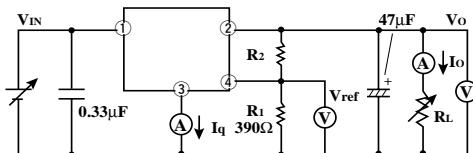

## ■ Electrical Characteristics

(Unless otherwise specified, condition shall be  $V_{IN}=12V$ ,  $V_o=10V$ ,  $I_o=1.5A$ ,  $R_i=390\Omega$ ,  $T_a=25^\circ C$ )

| Parameter                                    | Symbol      | Conditions                           | MIN.  | TYP.      | MAX.  | Unit          |
|--|-------------|--------------------------------------|-------|-----------|-------|---------------|
| Input voltage                                | $V_{IN}$    | -                                    | 4.5   | -         | 35    | V             |
| Output voltage                               | $V_o$       | -                                    | 1.5   | -         | 30    | V             |
| Load regulation                              | $RegL$      | $I_o=5mA$ to $3A$                    | -     | 0.5       | 2.0   | %             |
| Line regulation                              | $RegI$      | $V_{IN}=11$ to $21V$ , $I_o=0.5mA$   | -     | 0.5       | 2.5   | %             |
| Ripple rejection                             | $RR$        | Refer to Fig. 2                      | 45    | 70        | -     | dB            |
| Reference voltage                            | $V_{ref}$   | -                                    | 1.225 | 1.25      | 1.275 | V             |
| Temperature coefficient of reference voltage | $T_{CVref}$ | $T_a=0$ to $125^\circ C$ , $I_o=5mA$ | -     | $\pm 1.0$ | -     | %/ $^\circ C$ |
| Dropout voltage                              | $V_{i-o}$   | <sup>a3</sup> , $I_o=3A$             | -     | 0.3       | 1.0   | V             |
|  |             | <sup>a3</sup> , $I_o=2A$             | -     | 0.2       | 0.5   |               |
| Quiescent current                            | $I_q$       | $I_o=0$                              | -     | -         | 7     | mA            |

<sup>a3</sup> Input voltage shall be the value when output voltage is 95% in comparison with the initial value.

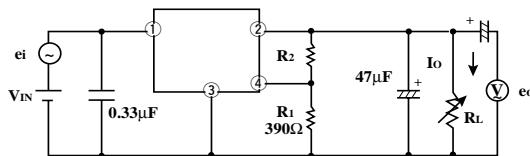

Fig.1 Test Circuit

$$V_o = V_{ref} \times \left( 1 + \frac{R_2}{R_1} \right) \approx 1.25 \times \left( 1 + \frac{R_2}{R_1} \right)$$

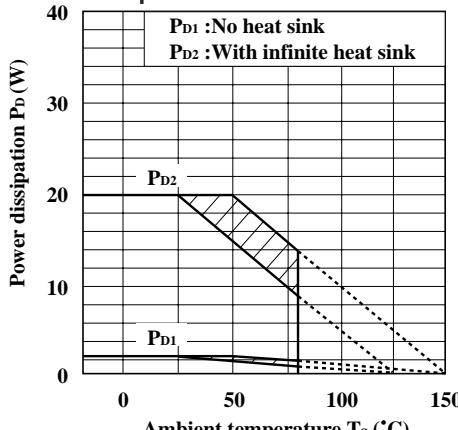

[ $R_1=390\Omega$ ,  $V_{ref} \approx 1.25V$ ]

Fig.2 Test Circuit of Ripple Rejection

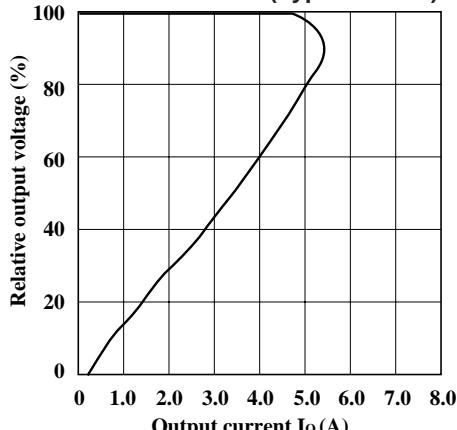

$I_o=0.5A$ ,  $V_{IN}=12V$ ,  $V_o=10V$   
 $f=120Hz$  (sine wave)  
 $ei=0.5V_{rms}$   
 $RR=20 \log (ei/eo)$

## ■ ON/OFF Operation

- ON/OFF operation is available by mounting externally D<sub>2</sub> and R<sub>3</sub>.
- When V<sub>ADJ</sub> is forcibly raised above V<sub>REF</sub> (1.25V TYP) by applying the external signal, the output is turned off (pass transistor of regulator is turned off). When the output is OFF, V<sub>ADJ</sub> must be higher than V<sub>REF</sub> MAX., and at the same time must be lower than maximum rating 7V.

In OFF-state, the load current flows to R<sub>L</sub> from V<sub>ADJ</sub> through R<sub>2</sub>. Therefore the value of R<sub>2</sub> must be as high as possible.

•  $V_o' = V_{ADJ} \times R_L / (R_L + R_2)$

occurs at the load. OFF-state equivalent circuit R<sub>1</sub> up to 10kΩ is allowed. Select as high value of R<sub>L</sub> and R<sub>2</sub> as possible in this range. In some case, as output voltage is getting lower (V<sub>O</sub><1V), impedance of load resistance rises. In such condition, it is sometime impossible to obtain the minimum value of V<sub>O'</sub>. So add the dummy resistance indicated by R<sub>D</sub> in the figure to the circuit parallel to the load.
