OM5202

DESCRIPTION

The OM5202 8-Bit ROMless Microcontroller is manufactured in an advanced CMOS process and is a derivative of the 80C51 microcontroller family. The OM5202 has the same instruction set as the 80C51.

See also:

- OM5232 8K bytes mask programmable ROM
- OM5234 16k bytes mask programmable ROM
- OM5238 32K bytes mask programmable ROM

This device provides architectural enhancements that make it applicable in a variety of applications for general control systems. The OM5202 contains no read-only program memory, a volatile 256×8 read/write data memory, four 8-bit I/O ports, two 16-bit timer/event counters (identical to the timers of the 80C51), a multi-source, two-priority-level, nested interrupt structure, UART and on-chip oscillator and timing circuits. The OM5202 can be expanded with standard TTL compatible memories and logic.

The device also functions as an arithmetic processor having facilities for both binary and BCD arithmetic plus bit-handling capabilities. The instruction set consists of over 100 instructions: 49 one-byte, 45 two-byte and 17 three-byte. With a 16MHz crystal, 58% of the instructions are executed in 0.75 μ s and 40% in 1.5 μ s. Multiply and divide instructions require 3 μ s.

FEATURES

- 80C51 central processing unit
- no internal ROM, externally up to 64k bytes
- 256 × 8 RAM, expandable externally to 64k bytes
- Two standard 16-bit timer/counters
- Four 8-bit I/O ports
- Two open drain I/O's (P1.6, P1.7)
- Full-duplex UART facilities
- Power control modes
 - Idle mode
 - Power-down mode
- Operating frequency range: 1.2 to 16 MHz
- Operating ambient temperature range: 0 to +70°C

PART NUMBER SELECTION

PHILIPS PART			
ORDER NUMBER PART MARKING	PACKAGE NUMBER	TEMPERATURE RANGE [°] C, PACKAGE	FREQUENCY MHz
OM5202/FBP	SOT129	0 to +70, Plastic Dual In–line Package, 40 leads	1.2 to 16
OM5202/FBB	SOT307-2	0 to +70, Plastic Quad Flat Pack, 44 leads	1.2 to 16

EQUIVALENT TYPES

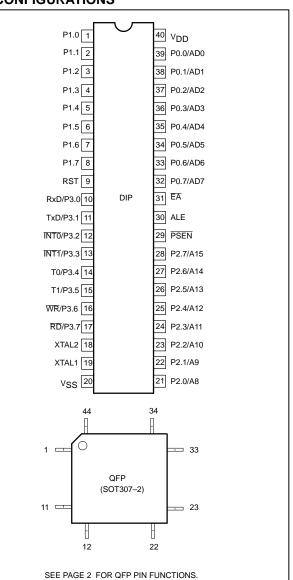

Details are as specified by the data sheet for the equivalent type:

OM5202 = P80C652 without I²C function.

OM5232 = P83C652 without I²C function.

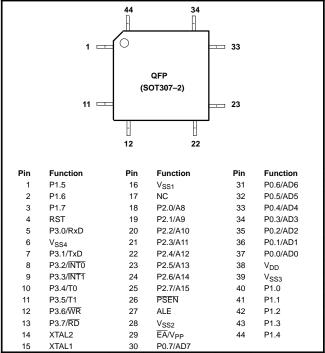

- OM5234 = P83C654 without I²C function.
- OM5238 = P83C528 without I²C function.

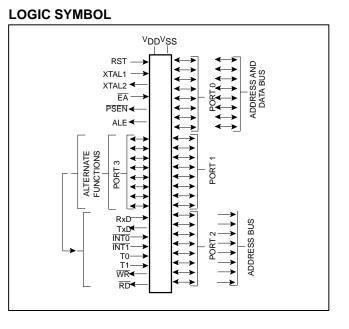

PIN CONFIGURATIONS

OM5202

QFP PIN FUNCTIONS

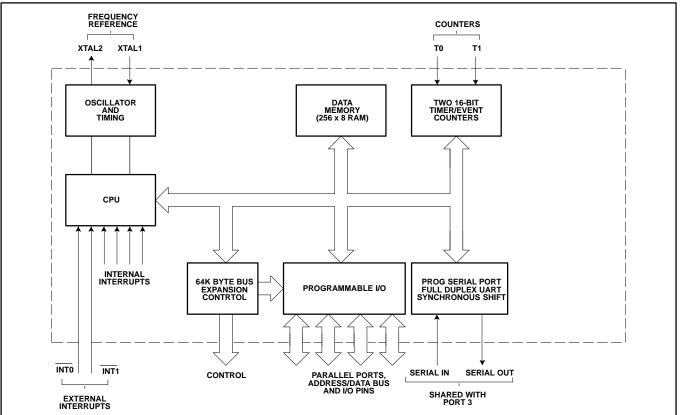

NOTE:

1. Due to EMC improvements, all V_{SS} pins (6, 16, 28, 39) must be connected to $V_{SS}.$

Table 1. OM5202 Special Function Registers

* SFRs are bit addressable.

SFRs are modified from or added to the 80C51 SFRs.

NOTE

1. Reserved for I^2C ; not supported in OM5202

OM5202

ROM CODE EXTERNAL (OM5202)

The MOVC instructions are the only instructions that have access to program code in the external program memory. The EA input is latched during RESET.

OSCILLATOR CHARACTERISTICS

XTAL1 and XTAL2 are the input and output, respectively, of an inverting amplifier. The pins can be configured for use as an on-chip oscillator, as shown in the Logic Symbol, page 2.

To drive the device from an external clock source, XTAL1 should be driven while XTAL2 is left unconnected. There are no requirements on the duty cycle of the external clock signal, because the input to the internal clock circuitry is through a divide-by-two flip-flop. However, minimum and maximum high and low times specified in the data sheet must be observed.

Reset

A reset is accomplished by holding the RST pin high for at least two machine cycles (24 oscillator periods), while the oscillator is running. To insure a good power-on reset, the RST pin must be high long enough to allow the oscillator time to start up (normally a few

milliseconds) plus two machine cycles. At power-on, the voltage on V_{DD} and RST must come up at the same time for a proper start-up.

Idle Mode

In the idle mode, the CPU puts itself to sleep while all of the on-chip peripherals stay active. The instruction to invoke the idle mode is the last instruction executed in the normal operating mode before the idle mode is activated. The CPU contents, the on-chip RAM, and all of the special function registers remain intact during this mode. The idle mode can be terminated either by any enabled interrupt (at which time the process is picked up at the interrupt service routine and continued), or by a hardware reset which starts the processor in the same manner as a power-on reset.

Power-Down Mode

In the power-down mode, the oscillator is stopped and the instruction to invoke power-down is the last instruction executed. Only the contents of the on-chip RAM are preserved. A hardware reset is the only way to terminate the power-down mode. The control bits for the reduced power modes are in the special function register PCON. Table 2 shows the state of the I/O ports during low current operating modes.

Table 2. External Pin Status During Idle and Power-Down Mode

ABSOLUTE MAXIMUM RATINGS^{1, 2, 3}

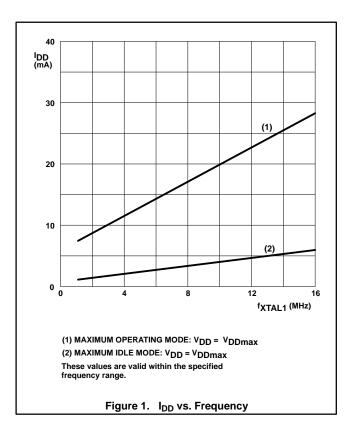

PARAMETER	RATING	UNIT
Storage temperature range	-65 to +150	°C
Voltage on any other pin to V _{SS}	-0.5 to + 6.5	V
Input, output current on any single pin	±5	mA
Power dissipation (based on package heat transfer limitations, not device power consumption)	1	W

NOTES:

 Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any conditions other than those described in the AC and DC Electrical Characteristics section of this specification is not implied.

2. This product includes circuitry specifically designed for the protection of its internal devices from the damaging effects of excessive static charge. Nonetheless, it is suggested that conventional precautions be taken to avoid applying greater than the rated maxima.

3. Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V_{SS} unless otherwise noted.

DC ELECTRICAL CHARACTERISTICS

 $V_{SS} = 0V$, $V_{DD} = 5.0V \pm 10\%$. Operating temperature range 0 to 70°C.

NOTES FOR DC ELECTRICAL CHARACTERISTICS:

1. See Figures 9 through 11 for I_{DD} test conditions.

2. The operating supply current is measured with all output pins disconnected; XTAL1 driven with $t_r = t_f = 5ns$;

 $V_{IL} = V_{SS} + 0.5V$; $V_{IH} = V_{DD} - 0.5V$; XTAL2 not connected; $\overline{EA} = RST = Port 0 = P1.6 = P1.7 = V_{DD}$. See Figure 9.

3. The idle mode supply current is measured with all output pins disconnected; XTAL1 driven with $t_r = t_f = 5ns$; $V_{IL} = V_{SS} + 0.5V$;

 $V_{IH} = V_{DD} - 0.5V$; XTAL2 not connected; Port 0 = P1.6 = P1.7 = V_{DD} ; $\overline{EA} = RST = V_{SS}$. See Figure 10.

4. The power-down current is measured with all output pins disconnected; XTAL2 not connected; Port 0 = P1.6 = P1.7 = V_{DD}; EA = RST = V_{SS}. See Figure 11.

5. $2V \leq V_{PD} \leq V_{DD}max$.

 Pins of ports 1, 2, and 3 source a transition current when they are being externally driven from 1 to 0. The transition current reaches its maximum value when V_{IN} is approximately 2V.

7. Capacitive loading on ports 0 and 2 may cause spurious noise to be superimposed on the V_{OL}s of ALE and ports 1 and 3. The noise is due to external bus capacitance discharging into the port 0 and port 2 pins when these pins make 1-to-0 transitions during bus operations. In the worst cases (capacitive loading > 100pF), the noise pulse on the ALE pin may exceed 0.8V. In such cases, it may be desirable to qualify ALE with a Schmitt Trigger, or use an address latch with a Schmitt Trigger STROBE input.

Under steady state (non-transient) conditions, I_{OL} must be externally limited as follows: Maximum I_{OL} = 10mA per port pin; Maximum I_{OL} = 26mA total for Port 0; Maximum I_{OL} = 15mA total for Ports 1, 2, and 3; Maximum I_{OL} = 71mA total for all output pins. If I_{OL} exceeds the test conditions, V_{OL} may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.
 Capacitive loading on ports 0 and 2 may cause the V_{OH} on ALE and PSEN to momentarily fall below the 0.9V_{DD} specification when the

 Capacitive loading on ports 0 and 2 may cause the V_{OH} on ALE and PSEN to momentarily fall below the 0.9V_{DD} specification when the address bits are stabilizing.

10. IDDMAX for other frequencies can be derived from Figure 1, where FREQ is the external oscillator frequency in MHz. IDDMAX is given in mA.

NOTES:

Parameters are valid over operating temperature range unless otherwise specified.
 Load capacitance for port 0, ALE, and PSEN = 100pF, load capacitance for all other outputs = 80pF.
 These values are characterized but not 100% production tested.

OM5202

ROMless 8-bit microcontroller

EXPLANATION OF THE AC SYMBOLS

Each timing symbol has five characters. The first character is always 't' (= time). The other characters, depending on their positions, indicate the name of a signal or the logical status of that signal. The designations are:

- A Address
- C Clock
- D Input data
- H Logic level high
- I Instruction (program memory contents)
- L Logic level low, or ALE
- P PSEN

Q - Output data

- R RD signal
- t Time
- V Valid
- W WR signal
- X No longer a valid logic level
- Z Float
- Examples: t_{AVLL} = Time for address valid

 - to ALE low. t_{LLPL} = Time for ALE low to PSEN low.

Product specification

ROMless 8-bit microcontroller

NOTE:

Ports 1.6 and 1.7 should be connected to V_{CC} through resistors of sufficiently high value such that the sink current into these pins does not exceed the I_{OL1} specification.
