

# Microprocessor Reset IC

## Features

- Precision Monitoring of +3V, +3.3V, and +5V Power-Supply Voltages
- Fully Specified Over Temperature
- Available in Three Output Configurations
  - Push-Pull  $\overline{\text{RESET}}$  Output (G670L)
  - Push-Pull  $\text{RESET}$  Output (G670H)
  - Open-Drain  $\overline{\text{RESET}}$  Output (G671L)
- 2ms max Power-On Reset Pulse Width
- 14 $\mu$ A Supply Current
- Guaranteed Reset Valid to  $V_{\text{CC}} = +1\text{V}$
- Power Supply Transient Immunity
- No External Components
- 3-Pin SOT-23, TO-92 and SOT-89 Packages
- 2% Threshold Accuracy

## Applications

- Computers
- Controllers
- Intelligent Instruments
- Critical  $\mu\text{P}$  and  $\mu\text{C}$  Power Monitoring
- Portable / Battery-Powered Equipment
- Automotive

## General Description

The G670/G671 are microprocessor ( $\mu\text{P}$ ) supervisory circuits used to monitor the power supplies in  $\mu\text{P}$  and digital systems. They provide excellent circuit reliability and low cost by eliminating external components and adjustments when used with +5V, +3.3V, +3.0V- powered circuits.

These circuits perform a single function: they assert a reset signal whenever the  $V_{\text{CC}}$  supply voltage declines below a preset threshold. Reset thresholds suitable for operation with a variety of supply voltages are available.

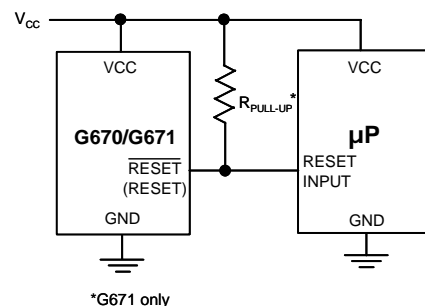

The G671L has an open-drain output stage, while the G670 have push-pull outputs. The G671L's open-drain  $\overline{\text{RESET}}$  output requires a pull-up resistor that can be connected to a voltage higher than  $V_{\text{CC}}$ . The G670L have an active-low  $\overline{\text{RESET}}$  output, while the G670H has an active-high  $\text{RESET}$  output. The reset comparator is designed to ignore fast transients on  $V_{\text{CC}}$ , and the outputs are guaranteed to be in the correct logic state for  $V_{\text{CC}}$  down to 1V.

Low supply current makes the G670/G671 ideal for use in portable equipment. The G670/G671 are available in 3-pin SOT-23, TO-92 and SOT-89 packages.

## Pin Configuration

## Typical Application Circuit

## Ordering Information

ORDER NUMBER	ORDER NUMBER (Pb free)	TEMP. RANGE	OUTPUT TYPE
G670LxxxTDxB	G670LxxxTDxBf	-40°C ~ +105°C	Push-Pull Active Low
G670HxxxTDxB	G670HxxxTDxBf	-40°C ~ +105°C	Push-Pull Active High
G671LxxxTDxB	G671LxxxTDxBf	-40°C ~ +105°C	Open-Drain
G670LxxxT2xU	G670LxxxT2xUf	-40°C ~ +105°C	Push-Pull Active Low
G670HxxxT2xU	G670HxxxT2xUf	-40°C ~ +105°C	Push-Pull Active High

## Order Number Identification

### PART NUMBER

G670L : Push-Pull Active Low Output  
 G670H : Push-Pull Active High Output  
 G671L : Open-Drain Output

### THRESHOLD VOLTAGE OPTION

\* xxx specifies the threshold voltage.  
 e.g. 263 denotes the 2.64V threshold voltage.

### PACKAGE TYPE

TD : TO-92  
 T2 : SOT-89  
 T7 : SOT-23

### PIN OPTION

1	2	3
1 : $\overline{\text{RESET}}$	GND	V <sub>CC</sub>
2 : RESET	V <sub>CC</sub>	GND
3 : GND	$\overline{\text{RESET}}$	V <sub>CC</sub>
4 : GND	V <sub>CC</sub>	$\overline{\text{RESET}}$
5 : V <sub>CC</sub>	GND	$\overline{\text{RESET}}$
6 : V <sub>CC</sub>	$\overline{\text{RESET}}$	GND

\*RESET for G670H

RESET Output Current High (push-pull active high, G670H)	I <sub>OH</sub>	V <sub>CC</sub> = 2.5V, V $\overline{\text{RESET}}$ = 2V	2	---	---	mA			
RESET Open-Drain Output Leakage Current (G671L)		V <sub>CC</sub> > V <sub>TH</sub> , $\overline{\text{RESET}}$ deasserted	---	---	1	$\mu\text{A}$			

Note 1: Production testing done at  $T_A = +25^\circ\text{C}$ ; limits over temperature guaranteed by design.

Note 2: RESET output is for G670L/G671L; While  $\overline{\text{RESET}}$  output is for G670H.

**Typical Operating Characteristics**

( $V_{CC}$  = full range,  $T_A$  =  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ , unless otherwise noted. Typical values are at  $T_A$  =  $+25^{\circ}\text{C}$ ,  $V_{CC}$  = 5V for 463/438/400 versions,  $V_{CC}$  = 3.3V for 308/293 versions, and  $V_{CC}$  = 3V for 263 version.)

**Recommended Minimum Footprint**

**Pin Description**

NAME	FUNCTION
GND	Ground
(G671L/G670L)	$\overline{\text{RESET}}$ Output remains low while $V_{CC}$ is below the reset threshold, and for at most 2ms after $V_{CC}$ rises above the reset threshold.
RESET (G670H)	RESET Output remains high while $V_{CC}$ is below the reset threshold, and for at most 2ms after $V_{CC}$ rises above the reset threshold.
VCC	Supply Voltage (+5V, +3.3V, +3.0V)

**Detailed Description**

A microprocessor's ( $\mu\text{P}$ 's) reset input starts the  $\mu\text{P}$  in a known state. The G671L/G670L/G670H assert reset to prevent code-execution errors during power-up, power-down, or brownout conditions. They assert a reset signal whenever the  $V_{CC}$  supply voltage declines below a preset threshold, keeping it asserted for at most 2ms after  $V_{CC}$  has risen above the reset threshold. The G671L uses an open-drain output, and the G670L/G670H have a push-pull output stage. Connect a pull-up resistor on the G671L's  $\overline{\text{RESET}}$  output to any supply between 0 and 5.5V.

**Figure 1. Maximum Transient Duration Without Causing a Reset Pulse vs. Reset Comparator Overdrive**

**Figure 2.  $\overline{\text{RESET}}$  Valid to  $V_{CC} = \text{Ground}$  Circuit**

**Applications Information**

**Negative-Going  $V_{CC}$  Transients**

In addition to issuing a reset to the  $\mu\text{P}$  during power-up, power-down, and brownout conditions, the G671L/G670H/G670L are relatively immune to short-duration negative-going  $V_{CC}$  transients (glitches).

Figure 1 shows typical transient duration vs. reset comparator overdrive, for which the G671L/G670H/G670L do not generate a reset pulse. The graph was generated using a negative-going pulse applied to  $V_{CC}$ , starting 0.5V above the actual reset threshold and ending below it by the magnitude indicated (reset comparator overdrive). The graph indicates the maximum pulse width a negative-going  $V_{CC}$  transient can have without causing a reset pulse. As the magnitude of the transient increases (goes farther below the reset threshold), the maximum allowable pulse width decreases. Typically, for the G67\_ \_ 463 and G67\_ \_ 438, a  $V_{CC}$  transient that goes 100mV below the reset threshold and lasts 7 $\mu\text{s}$  or less will not cause a reset pulse. A 0.1 $\mu\text{F}$  bypass capacitor mounted as close as possible to the  $V_{CC}$  pin provides additional transient immunity.

**Ensuring a Valid Reset Output Down to  $V_{CC} = 0$**

When  $V_{CC}$  falls below 1V, the G670  $\overline{\text{RESET}}$  output no longer sinks current—it becomes an open circuit. Therefore, high-impedance CMOS logic inputs connected to  $\overline{\text{RESET}}$  can drift to undetermined voltages. This presents no problem in most applications since most  $\mu\text{P}$  and other circuitry is inoperative with  $V_{CC}$  below 1V. However, in applications where  $\overline{\text{RESET}}$  must be valid down to 0V, adding a pull-down resistor to  $\overline{\text{RESET}}$  causes any stray leakage currents to flow to ground, holding  $\overline{\text{RESET}}$  low (Figure 2). R1's value is not critical; 100k $\Omega$  is large enough not to load  $\overline{\text{RESET}}$  and small enough to pull  $\overline{\text{RESET}}$  to ground. A 100k $\Omega$  pull-up resistor to  $V_{CC}$  is also recommended for the G671L if  $\overline{\text{RESET}}$  is required to remain valid for  $V_{CC} < 1\text{V}$ .

**Figure 3. Interfacing to  $\mu$ Ps with Bidirectional Reset I/O**

**Figure 4. G671L Open-Drain  $\overline{\text{RESET}}$  Output Allows Use with Multiple Supplies**

**Interfacing to  $\mu$ Ps with Bidirectional Reset Pins**

Since the  $\overline{\text{RESET}}$  output on the G671L is open drain, this device interfaces easily with  $\mu$ Ps that have bidirectional reset pins, such as the Motorola 68HC11. Connecting the  $\mu$ P supervisor's  $\overline{\text{RESET}}$  output directly to the microcontroller's ( $\mu$ C's)  $\overline{\text{RESET}}$  pin with a single pull-up resistor allows either device to assert reset (Figure 3).

**G671L Open-Drain  $\overline{\text{RESET}}$  Output Allows Use with Multiple Supplies**

Generally, the pull-up connected to the G671L will connect to the supply voltage that is being monitored at the IC's  $V_{CC}$  pin. However, some systems may use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 4). Note that as the G671L's  $V_{CC}$  decreases below 1V, so does the IC's ability to sink current at  $\overline{\text{RESET}}$ . Also, with any pull-up,  $\overline{\text{RESET}}$  will be pulled high as  $V_{CC}$  decays toward 0. The voltage where this occurs depends on the pull-up resistor value and the voltage to which it is connected.

**Benefits of Highly Accurate Reset Threshold**

Most  $\mu$ P supervisor ICs have reset threshold voltages between 5% and 10% below the value of nominal supply voltages. This ensures a reset will not occur within 5% of the nominal supply, but will occur when the supply is 10% below nominal.

When using ICs rated at only the nominal supply  $\pm 5\%$ , this leaves a zone of uncertainty where the supply is between 5% and 10% low, and where the reset may or may not be asserted.

The G67\_463/G67\_308 use highly accurate circuitry to ensure that reset is asserted close to the 5% limit, and long before the supply has declined to 10% below nominal.
