

**4-CHANNEL MOTOR DRIVER WITH POWER CONTROLLER****AM5901A****General Description**

The AM5901A is a 4-channel motor driver with power controller that includes the reset, battery charge and reduced voltage detection circuits required for portable CD/MP3/VCD players on a single chip.

This kind of IC is provided with lower startup voltage and power consumption than similar products, its driver block power supply uses on-chip switching regulator, making this component an ideal choice for low-power sets. It is used in mini portable compact disc players (CDP), portable mini disc players (MD), disc-man or other portable compact disc media.

The AM5901A is available in PQFP-44 and LQFP-44 packages.

**Features**

- 4-channel H-bridge Driver
- Built-in DC/DC Converter Control Circuit
- Built-in Reset Circuit
- Built-in Reduced Voltage Detection Circuit
- Built-in Battery Charging Circuit
- Built-in General-purpose Operational Amplifier
- Built-in Thermal Shutdown Circuit
- Low Power Consumption

**Applications**

- Portable Compact Disc Player (CDP)
- Portable Mini Disc Player
- Portable Disc-man
- Portable CD/MP3/VCD
- Other Portable Compact Disc Media

## Pin Description

Pin Number	Pin Name	Function
1	BSEN	Battery voltage monitor
2	BATT	Battery power supply input
3	RESET	Reset detection output
4	DEAD	Dead-time setting
5	SW	Booster transistor drive
6	EO	Error amplifier output
7	EI	Error amplifier input
8	SPRT	Short-circuit protection setting
9	C <sub>T</sub>	Triangular wave output
10	N.C.	Nothing connected
11	OP-	Operational amplifier negative input
12	VSYS1	Control circuit power supply input
13	OPOUT	Operational amplifier output
14	OP+	Operational amplifier positive input
15	VSYS2	Pre-driver power supply input
16	V <sub>REF</sub>	Reference power supply input
17	IN3	CH3 control signal input
18	IN4	CH4 control signal input
19	MUTE34	CH3/CH4 mute
20	IN2	CH2 control signal input
21	MUTE2	CH2 mute
22	IN1	CH1 control signal input
23	BRAKE1	CH1 brake
24	OUT4R	CH4 negative output
25	OUT4F	CH4 positive output
26	OUT3R	CH3 negative output
27	OUT3F	CH3 positive output
28	POWGND	Power unit power ground
29	OUT2F	CH2 positive output
30	OUT2R	CH2 negative output
31	OUT1F	CH1 positive output
32	OUT1R	CH1 negative output
33	RCHG	Charging current setting
34	AMUTE	Reset inversion output
35	EMP	"Empty" detection output
36	HV <sub>CC</sub>	H-bridge power supply input
37	PSW	PWM transistor drive
38	CLK	External clock synchronization input
39	START	Boost DC/DC converter starting
40	OFF	Boost DC/DC converter OFF
41	CHGVcc	Charging circuit power supply input
42	SEL	"Empty" detection level switching
43	PREGND	Pre-unit power supply ground
44	PWMFIL	PWM phase compensation

### Ordering Information

Package	Temperature Range	Part Number		Marking ID		Packing Type
		Tin Lead	Lead Free	Tin Lead	Lead Free	
PQFP-44	0 to 70°C	AM5901AF44	AM5901AF44-E1	AM5901AF44	AM5901AF44-E1	Tray
LQFP-44	0 to 70°C	AM5901ALF44	AM5901ALF44-E1	AM5901ALF44	AM5901ALF44-E1	Tray

BCD Semiconductor's Pb-free products, as designated with "E1" suffix in the part number, are RoHS compliant.

## 4-CHANNEL MOTOR DRIVER WITH POWER CONTROLLER

AM5901A

**Absolute Maximum Ratings (Note 1)**

Parameter	Symbol	Value	Unit
Supply Voltage	V <sub>CC</sub>	13.5	V
Driver Output Current	I <sub>O</sub>	500	mA
Power Dissipation	P <sub>D</sub>	625 (Note 2)	mW
Operating Junction Temperature	T <sub>J</sub>	150	°C
Storage Temperature	T <sub>STG</sub>	-55 to 150	°C

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: Power dissipation is reduced by 5mW for each increase in T<sub>A</sub> of 1°C over 25°C.

**Recommended Operating Conditions**

Parameter	Symbol	Min	Typ	Max	Unit
Control Circuit Power Supply Voltage	V <sub>SYS1</sub>	2.7	3.2	5.5	V
Pre-driver Power Supply Voltage	V <sub>SYS2</sub>	2.7	3.2	5.5	V
H-bridge Power Supply Voltage	HV <sub>CC</sub>		PWM	BATT	V
Power Unit Power Supply Voltage	BATT (V <sub>CC</sub> )	1.6	2.4	8	V
Charging Circuit Power Supply Voltage	CHGV <sub>CC</sub>	3.0	4.5	8	V
Operating Temperature	T <sub>A</sub>	0	25	70	°C

AM5901A

## Typical Application

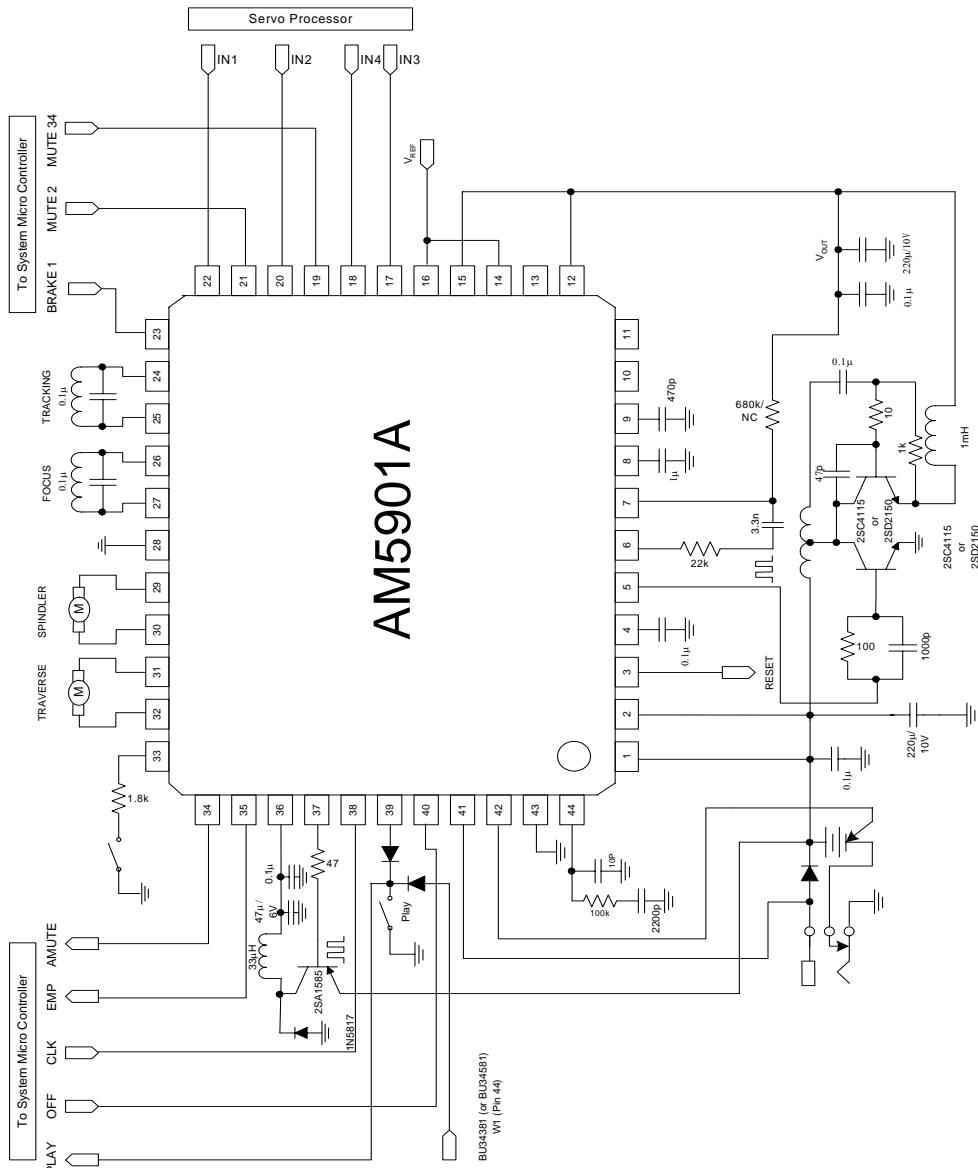

Figure 9. Typical Application 1 of AM5901A in Portable CD/VCD Player

## 4-CHANNEL MOTOR DRIVER WITH POWER CONTROLLER

AM5901A

## Application Information

## H-Bridge Driver

## 1. Mute Function

Brake function is assigned to CH1, mute function is assigned to other 3 channels.

(1) CH1 is in normal operation when the BRAKE pin is low (high when CH1 mute on), and enters a brake mode.

(2) CH2 is in normal operation when the MUTE2 pin is low (high when CH2 mute on).

(3) CH3,4 are in normal operation when the MUTE34 pin is high (low when CH3,4 mute on).

2. V<sub>REF</sub> Drop Mute

When the voltage impressed to V<sub>REF</sub> terminal is 1.0V (Typ.) or less, impedance of driver output becomes "high".

## 3. Thermal Shutdown

If the chip temperature rises above 140 °C, then the thermal shutdown (TSD) circuit is activated and the output current is cut. When the chip temperature has dropped to 100°C, then output current begins to flow.

## 4. Driver Gain

Driver input resistance is 11kΩ (CH1, CH3, CH4) and 7.5kΩ (CH2). Driver gain can be calculated by the expression.

$$\text{CH1,3,4} \quad G_V = 20 \log |55k/(R+11k)|$$

$$\text{CH2} \quad G_V = 20 \log |110k/(R+7.5k)|$$

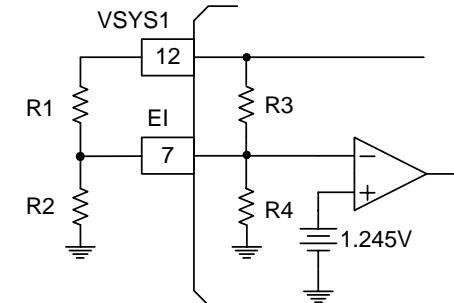

R is an external resistance

The power supply of driver output stage is HV<sub>CC</sub> terminal and that of pre-driver circuit is VSYS2 terminal. Attach a by-pass capacitor (approximately 0.1μF) between the power supplies as near as possible to this chip.

## DC/DC Converter Control Circuit

## 1. Output Voltage

Booster circuit of voltage (VSYS1) can be configured with external component. The voltage is defined as follows.

$$\text{VSYS1} = 1.245 * \frac{\frac{R1*R3}{(R1+R3)} + \frac{R2*R4}{(R2+R4)}}{\frac{R2*R4}{(R2+R4)}} \text{ (V)}$$

R1 = External Resistance

R2 = External Resistance

R3 = 35kΩ

R4 = 21kΩ

## 2. Short-Circuit Protection Function

When the output of error amplifier is "H", if the voltage of SPRT terminal has reached 1.245V (Typ.) upon charging the terminal, switching of SW terminal is disabled. Time to disable switching depends on the capacitor of SPRT terminal and it can be calculated by the expression:

$$t = C_{SPRT} * V_{TH}/I_{SPRT} \text{ (sec)}$$

(V<sub>TH</sub>=1.245V, I<sub>SPRT</sub>=10μA)

## 4-CHANNEL MOTOR DRIVER WITH POWER CONTROLLER

AM5901A

## Application Information (Continued)

## 3. Soft-Start Function

The soft-start is functioned by putting a capacitor between DEAD terminal and GND, the maximum duty can be changed by attaching a resistance to pin 4.

$$t = C_{DEAD} * R \text{ (sec)}$$

$$(R=65k\Omega)$$

## 4. Power-Off Operation

SPRT terminal is charged by setting OFF terminal to "L". Then, switching of SW terminal is terminated when the voltage of the SPRT terminal has reached 1.245V (Typ.). Time to disable switching depends on a capacitor of the SPRT terminal and it can be calculated by the expression:

$$t = C_{SPRT} * V_{TH}/I_{HV} \text{ (sec)}$$

$$(V_{TH} = 1.245V, I_{HV} = 20\mu A)$$

## 5. Over-Voltage Protection Operation

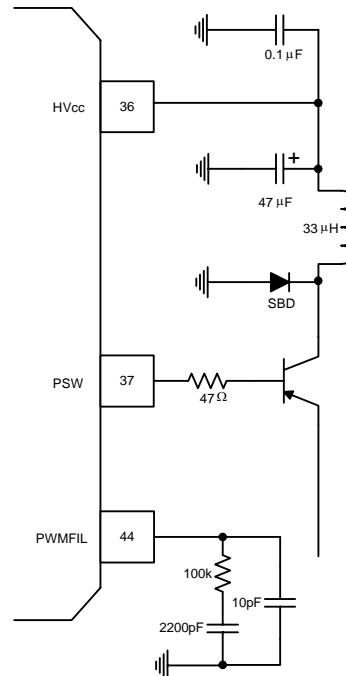

When the voltage applied to BSEN terminal has been 8.4V (Typ.), SPRT terminal is charged. Then, switching of SW terminal is terminated when the voltage of the SPRT terminal has reached 1.245V (Typ.). Time to disable switching depends on a capacitor of SPRT terminal and it can be calculated by the expression:

$$t = C_{SPRT} * V_{TH}/I_{HV} \text{ (sec)}$$

$$(V_{TH} = 1.245V, I_{HV} = 20\mu A)$$

## PWM Power Supply Driver Circuit

This circuit detects a maximum output level of drivers of four channels and performs the PWM supply of load drive power supply. This circuit uses PNP transistor, Schottky Diode and capacitor as external component.

## "Empty" Detector Unit

When the voltage applied to BSEN terminal has reached the detecting voltage or less. EMP terminal varies from "H" to "L" (open collector output). Hysteresis of 50mV (Typ.) is set to the detecting voltage to prevent the output chattering. The detecting voltage varies depending on SEL terminal as follows:

SEL Pin	Detecting Voltage	Return Voltage
L	2.2V (Typ.)	2.25V (Typ.)
High-Z	1.8V (Typ.)	1.85V (Typ.)

**4-CHANNEL MOTOR DRIVER WITH POWER CONTROLLER****AM5901A****Application Information (Continued)****Reset Circuit**

Upon 90% of DC/DC converter output voltage, RESET terminal varies from "L" to "H" and AMUTE terminal changes from "H" to "L". Hysteresis of 50mV (Typ.) is set to the reset voltage to prevent the output chattering.

**Charging Circuit**

The power supply of the charging unit is from CHGV<sub>CC</sub> terminal and it is independent of any

other circuits. Charging current is set by the resistance between RCHG terminal and GND. The charging current takes constant current through SEL terminal.

This circuit has a private thermal shutdown circuit. When the chip temperature has risen to 140°C, the charging current is cut off. When the chip temperature has dropped to 100°C, the charging current begins to flow.
