

# FHP3131

## 0.4mA, 2.5V to 12V, 70MHz Rail-to-Rail Amplifier

### Features at +5V

- 0.4mA supply current
- 70MHz bandwidth at unity gain
- Power down to 30µA
- Output voltage range at  $R_L = 1k\Omega$ : 0.07V to 4.8V
- Input extends below negative rail: -0.3V to 4V
- 50V/µs slew rate
- 12nV/Hz input voltage noise
- Small SOT23-6 and MicroPak™ -6 package options
- Fully specified at +2.7V, +5V, and ±5V supplies

### Applications

- Portable/battery-powered applications
- A/D buffer
- Active filters
- Portable test instruments
- Set-top box
- HDTV
- DVD players and recorders
- Coaxial cable drivers
- Video driver

### Description

The FHP3131 is a high-performance, voltage-feedback amplifier that consumes only 0.4mA of supply current while providing 70MHz of bandwidth and 50V/µs slew rate. The FHP3131 is designed to operate from 2.5V to 12V (±6V) supplies. The common mode voltage range extends below the negative rail and the output provides rail-to-rail performance.

The FHP3131 is fabricated on a complementary bipolar process. The combination of low power, rail-to-rail performance, low voltage operation, and tiny package options make this amplifier well suited for use in many general-purpose, high-speed applications.

For power sensitive applications, the FHP3131 offers unparalleled dynamic performance. It also offers a shut-down feature to lower the supply current draw below 30µA. The FHP3131 is available in space-saving 6-lead SOT23 or MicroPak™ packages and operates from -40°C to +85°C.

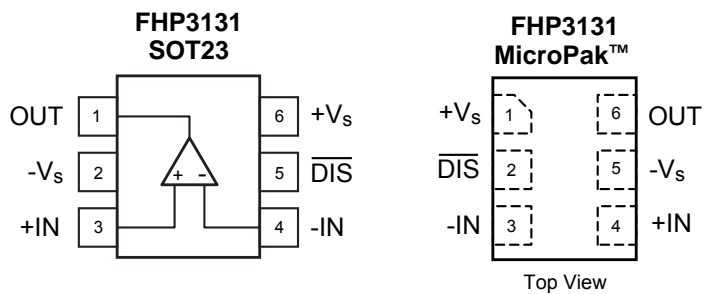

### Ordering Information

Part Number	Package	Pb-Free	Operating Temperature Range	Packaging Method
FHP3131IS6X	SOT23-6	Yes	-40°C to +85°C	Reel
FHP3131IL6X	MicroPak-6	Yes	-40°C to +85°C	Reel

Moisture sensitivity level for all parts is MSL-1.

MicroPak™ is a trademark of Fairchild Semiconductor Corporation.

## Pin Configurations

## Pin Assignments

Pin # SOT/MicroPak	Name	Description
1/6	OUT	Output
2/5	-V <sub>s</sub>	Negative supply
3/4	+IN	Positive input
4/3	-IN	Negative input
5/2	$\overline{\text{DIS}}$	Leave floating or pull high to enable. Pull low to disable.
6/1	+V <sub>s</sub>	Positive supply

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Parameter	Min.	Max.	Unit
Supply Voltage	0	12.6	V
Input Voltage Range	$-V_s - 0.5V$	$+V_s + 0.5V$	V

## Reliability Information

Parameter	Min.	Typ.	Max.	Unit
Junction Temperature			150	°C
Storage Temperature Range	-65		150	°C
Reflow Temperature (Soldering)			260	°C
Package Thermal Resistance	6-Lead SOT23 <sup>(1)</sup>	302		°C/W
	6-Lead MicroPak™ <sup>(1)</sup>	440		°C/W

### Notes:

1. Package thermal resistance ( $\theta_{JA}$ ), JEDEC standard, multi-layer test boards, still air.

## ESD Protection

Product	FHP3131
Human Body Model (HBM)	4kV
Charged Device Model (CDM)	2kV

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Parameter	Min.	Typ.	Max.	Unit
Operating Temperature Range	-40		+85	°C
Supply Voltage Range	2.5		12	V

## Application Information

### Driving Capacitive Loads

The *Frequency Response vs.  $C_L$*  Figure 7 on page 8, illustrates the response of the FHP3131. A small series resistance ( $R_s$ ) at the output of the amplifier, illustrated in Figure 31, improves stability and settling performance.  $R_s$  values in the *Frequency Response vs.  $C_L$*  figure were chosen to achieve maximum bandwidth with less than 1dB of peaking. For maximum flatness, use a larger  $R_s$ .

**Figure 31. Typical Topology for Driving Capacitive Loads**

### Enable/Disable Function

The FAN3131 offers an active-low disable pin that can be used to lower its supply current. Leave the pin floating to enable the part. Pull the disable pin to the negative supply (which is ground in a single-supply application) to disable the output.  $V_{ON}$  and  $V_{OFF}$  thresholds are listed in the table below. During the disable condition, the nominal supply current drops to below  $33\mu A$  and the output is at high impedance with about  $2.8pF$  capacitance.

At 2.7V		At 5V		At $\pm 5V$	
$V_{ON}$	$V_{OFF}$	$V_{ON}$	$V_{OFF}$	$V_{ON}$	$V_{OFF}$
$V_S-1.1$	$V_S-1.75$	$V_S-1.2$	$V_S-1.9$	$V_S-1.4$	$V_S-2.9$

### $\pm 5V$ Drive Capability

Figure 32 illustrates the drive capability of the FHP3131 during  $\pm 5V$  supply voltage operation. The two examples below demonstrate the use of this graph:

- To adequately drive  $2V_{pp}$  into a  $150\Omega$  ground-centered load, the FHP3131 must supply  $\pm 6.67mA$  of output current. From the graph, the points created by  $(-6.7mA, -1V)$  and  $(+6.7mA, +1V)$  both lie within the linear region of the curve. So, the FHP3131 can drive  $2V_{pp}$  into a  $150\Omega$  ground-centered load.
- To adequately drive  $5V_{pp}$  into a  $100\Omega$  load, the FHP3131 must supply  $\pm 25mA$  of output current. From the graph, the point created by  $(+25mA, +2.5V)$  lies within the linear region of the curve; however, the point created by  $(-25mA, -2.5V)$  does not. So, the FHP3131 is not capable of driving  $5V_{pp}$  into a  $100\Omega$  ground-centered load at  $\pm 5V$ .

**Figure 32. Output Current vs. Output Voltage**

### Power Dissipation

The maximum internal power dissipation allowed is directly related to the maximum junction temperature. If the maximum junction temperature exceeds  $150^\circ C$  for an extended time, device failure may occur. While the FHP3131 is short-circuit protected, this may not guarantee that the maximum junction temperature ( $+150^\circ C$ ) is not exceeded under all conditions. RMS Power Dissipation can be calculated using the following equation:

Power Dissipation =

$$I_s * (V_{S+} - V_{S-}) + (V_{S+} - V_{OUT(RMS)}) * I_{OUT(RMS)} \quad \text{EQ. 1}$$

where  $I_s$  is the supply current,  $V_{S+}$  is the positive supply pin voltage,  $V_{S-}$  is the negative supply pin voltage,  $V_{OUT(RMS)}$  is the RMS output voltage, and  $I_{OUT(RMS)}$  is the RMS output current delivered to the load. Follow the maximum power derating curves shown in Figure 33 below to ensure proper operation.

**Figure 33. Maximum Power Derating**

### Overdrive Recovery

For an amplifier, an overdrive condition occurs when the output and/or input ranges are exceeded. The recovery time varies based on whether the input or output is overdriven and by how much the ranges are exceeded. The FHP3131 typically recovers in less than 25ns from an overdrive condition. Figure 34 shows the FHP3131 in an overdriven condition.

Figure 34. Overdrive Recovery

### Layout Considerations

General layout and supply bypassing play major roles in high-frequency performance. Fairchild has evaluation boards to guide high-frequency layout and aid device testing and characterization. Follow the guidelines below as a basis for high-frequency layout:

- Include 6.8µF and 0.01µF ceramic capacitors.
- Place the 6.8µF capacitor within 0.75 inches of the power pin.
- Place the 0.01µF capacitor within 0.1 inches of the power pin.
- Remove the ground plane under and around the part, especially near the input and output pins, to reduce parasitic capacitance.
- Minimize all trace lengths to reduce series inductances.

Refer to the evaluation board layouts shown in Figures 36-39 for more information.

### Evaluation Board Information

The following evaluation boards are available to aid testing and layout of these devices:

**DISCLAIMER**

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

**PRODUCT STATUS DEFINITIONS**

**Definition of Terms**

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild Semiconductor. The datasheet is printed for reference information only.
