Note: Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook (“Handling Precautions”/“Derating Concept and Methods”) and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

AC Characteristics (Ta = –40 to 85°C, input $t_r = t_f = 2.0$ ns, $C_L = 30$ pF, $R_L = 500\ \Omega$)

Characteristics	Symbol	Test Condition	V_{CC} (V)	Min	Max	Unit

			2.5 ± 0.2	—	7

The propagation delay time is defined by test condition as follows: (calculating condition: see Figure 3)

Propagation delay time (reference) = $-(C_{OS} + C_L) \cdot (R_{DRIVE} + R_{ON}) \cdot \ln(((V_{OH} - V_{OL}) - V_M) / (V_{OH} - V_{OL}))$

R_{DRIVE} = Output impedance of front circuit
V_M= Arbitrary output threshold voltage

Example of calculation:
Propagation delay time (reference) = $-(15 + 15) \cdot (0 + 21) \cdot \ln(((3.6 - 0) - 3.6 \cdot 50\%) / (3.6 - 0))$
= approximately 0.4 ns

Calculating condition:
V_{CC} = 3.6V , C_L = 15pF , R_{DRIVE} = 0 Ω (ideal signal source) , V_M = 50%
Input signal to switch = Digital signal (“H” revel voltage=3.6V , ”L” revel voltage = 0V)

Note 1: C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current is given as:
$I_{CC\ (opr.)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}$
