

Precision Operational Amplifier

■ GENERAL DESCRIPTION

- Precision $V_{IO}=60\mu\text{V max.}$
 $V_{IO}=100\mu\text{V max. (Ta}=-40^{\circ}\text{C to }+85^{\circ}\text{C)}$
- Low Offset Drift $\Delta V_{IO}/\Delta T=0.9\mu\text{V}/^{\circ}\text{C max. (Ta}=-40 \text{ to } +85^{\circ}\text{C)}$
- Specified for $\pm 15\text{V}$ and $\pm 5\text{V}$ operation
- CMR 130dB min.
- Low Noise $V_{NI}=80\text{nVrms typ. at }f=1 \text{ to } 100\text{Hz}$
 $e_n=8\text{nV}/\sqrt{\text{Hz typ. at }f=100\text{Hz}}$
- Open Loop Gain $A_v=130\text{dB min.}$
- Guaranteed Temperature $T_a=-40^{\circ}\text{C to }+85^{\circ}\text{C}$
- Unity Gain Stable
- Operating Voltage $V_{opr}=\pm 3\text{V to } \pm 18\text{V}$
- Unity Gain Frequency $f_T=1.1\text{MHz typ.}$
- Supply Current $I_{CC}=2\text{mA max.}$
- Package EMP8

■ PACKAGE OUTLINE

NJM2729E

■ FEATURES

The NJM2729 is a high performance operational amplifier featured very low offset voltage and drift.

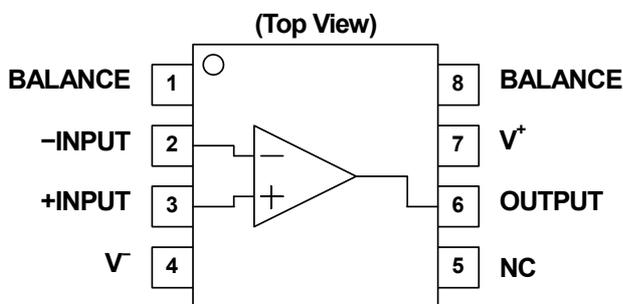

Features are low offset voltage and drift, hi common mode rejection, low noise and open loop gain. DC characteristics are 100% tested and specified from -40 to 85°C .

The NJM2729 is suitable for high gain circuit amplified small signal and sets required stable behavior over a wide temperature range.

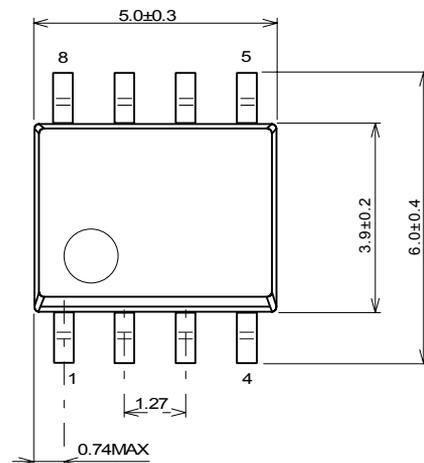

■ APPRICATION

- Thermocouple sensor
- Bridge Amplifier
- Current Sensor
- Instrumentation Amplifier
- Reference Voltage Circuit

■ PIN CONFIGURATION

■ PACKAGE DESCRIPTION

NJM2729

■ ABSOLUTE MAXIMUM RATING (Ta=25°C Unless Otherwise Specified)

PARAMETER	SYMBOL	RATING	UNIT
Supply Voltage	V ⁺ /V ⁻	±20	V
Common Mode Input Voltage (Note1)	V _{ICM}	±20	V
Differential Input Voltage	V _{ID}	±30	V
Power Dissipation (Note 2)	P _D	640	mW
Operating Temperature	T _{opr}	-40 to +85	°C
Storage Temperature	T _{stg}	-50 to +125	°C

(Note1) For supply voltage less than ±20V, the maximum input voltage is equal to the supply voltage.

(Note2) Mounted on the EIA/JEDEC standard board (76.2×114.3×1.6mm, two layer, FR-4).

■ RECOMMENDED OPERATING VOLTAGE

● EXPLANATION OF MEASUREMENT CONDITION

PARAMETER	Explanation
Input Offset Voltage Drift	$\text{Input Offset Voltage Drift} = \Delta V_{IO} / \Delta t$ $\Delta t : \text{Amount of Temperature change.}$ $\Delta V_{IO} : \text{Amount of Input Offset Voltage.}$
Common Mode Input Voltage range	A range of input voltage at which the operational amplifier can function.
Common Mode Rejection Ratio	$\text{CMR} = 20 \log (\Delta V_{IN} / \Delta V_{IO}) $ $\Delta V_{IN} : \text{Amount of Input Voltage.}$ $\Delta V_{IO} : \text{Amount of Input Offset Voltage.}$
Supply Voltage Rejection Ratio	$\text{SVR} = 20 \log (\Delta V_S / \Delta V_{IO}) $ $\Delta V_S : \text{Amount of supply Voltage.}$ $\Delta V_{IO} : \text{Amount of Input Offset Voltage.}$
Common Mode Input Impedance	$R_{INCM} = \Delta V_{IN} / \Delta I_B$ $\Delta V_{IN} : \text{Amount of Input Voltage.}$ $\Delta I_B : \text{Amount of Input bias current.}$
Voltage Gain	$AV = 20 \log (\Delta V_{IN} / \Delta V_O) $ $\Delta V_O : \text{Amount of output Voltage.}$ $\Delta V_{IN} : \text{Amount of Input Voltage.}$

■ Application Information

● Power Supply Bypassing

The NJM2729 is a high precision operational amplifier featuring low offset voltage, high voltage gain, high CMR, high SVR and so on. To maximize such a high performance with stable operation, the NJM2729 should be operated by clean and low impedance supply voltage. So, the bypass capacitor should be connected to the NJM2729's both power supply terminals (V+ and V-) as shown in Fig.1. The bypass capacitors should be placed as close as possible to IC package

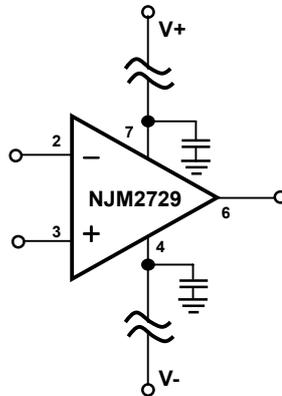

Fig.1 Power Supply Bypassing Circuit

● Thermoelectric Effect

The NJM2729 is a high precision operational amplifier featuring low offset voltage and low offset voltage thermal drift. To achieve such a high performance, take care about thermoelectric effect possibly occurs on each input terminal of the NJM2729. Generally, if there are thermal mismatches at the junction of different types of metals, the thermoelectric voltage (Seebeck effect) occurs at the junction. The thermoelectric voltages possibly occur at the junction of PCB metal patterns and NJM2729's each input terminal metal. If there is thermal mismatch in-between NJM2729's each input terminal metal, the thermoelectric voltages generated on each input terminal possibly have different voltage each. This voltage difference causes offset voltage and offset voltage thermal drift of the NJM2729. To minimize this voltage difference, the thermal mismatch in-between NJM2729's each input terminal and PCB metal should be minimized.

● Offset Voltage Adjustment

The NJM2729 has offset voltage trim terminals (pin1 and pin8) as shown in below Fig.2. By connecting external potentiometer in the range of 20Kohm, the offset voltage trim range is $\pm 3\text{mV}$. This offset voltage trim is effective only for offset voltage at room temperature, not for offset voltage thermal drift. If offset voltage adjustment is not in use, leave pin1 and pin8 open (un-connected).

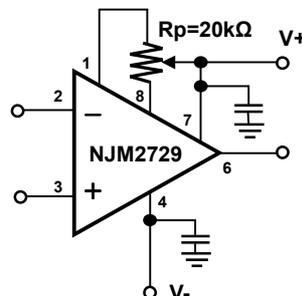

Fig.2 Offset Voltage Trim Circuit

NJM2729

•Differential Amplifier

Differential amplifier (see below Fig.3) is used in high accuracy circuit to improve common mode rejection ratio (CMR). A matching between the ratio $R_1/R_2 = R_3/R_4$ and $R_1=R_3$ makes the high CMR. For example, acceptable error range to obtain CMR of 130dB or more is about 0.1ppm.
