1. Overview

1.1 Features

The M16C/6C Group microcomputer (MCU) incorporates the M16C/60 Series CPU core and flash memory, employing sophisticated instructions for a high level of efficiency. This MCU has 1 MB of address space and it is capable of executing instructions at high speed. In addition, the CPU core boasts a multiplier for high-speed operation processing.

This MCU consumes low power, and supports operating modes that allow additional power control. The MCU also uses an anti-noise configuration to reduce emissions of electromagnetic noise and is designed to withstand electromagnetic interference (EMI). By integrating many of the peripheral functions, including the multifunction timer and serial interface, the number of system components has been reduced.

1.1.1 Applications

This MCU can be used in personal computer peripherals (USB compatible products), audio components, cameras, televisions, household appliances, office equipment, communication devices, mobile devices, industrial equipment, and other applications.

Note: This product has been designed and developed for the purpose of being used in consumer products. It cannot be used with products that require a high level of quality such as automotive electronics.

2.8.8 Stack Pointer Select Flag (U Flag)

ISP is selected when the U flag is 0. USP is selected when the U flag is 1.
The U flag becomes 0 when a hardware interrupt request is accepted, or the INT instruction of software interrupt number 0 to 31 is executed.

2.8.9 Processor Interrupt Priority Level (IPL)

IPL is 3 bits wide and assigns processor interrupt priority levels from 0 to 7.
If a requested interrupt has higher priority than IPL, the interrupt request is enabled.

2.8.10 Reserved Areas

Only set these bits to 0. The read value is undefined.

3. Address Space

3.1 Address Space

The M16C/6C Group has a 1 MB address space from 00000h to FFFFFh. Figure 3.1 shows the Address Space. Areas that can be accessed vary depending on processor mode and the status of each control bit.

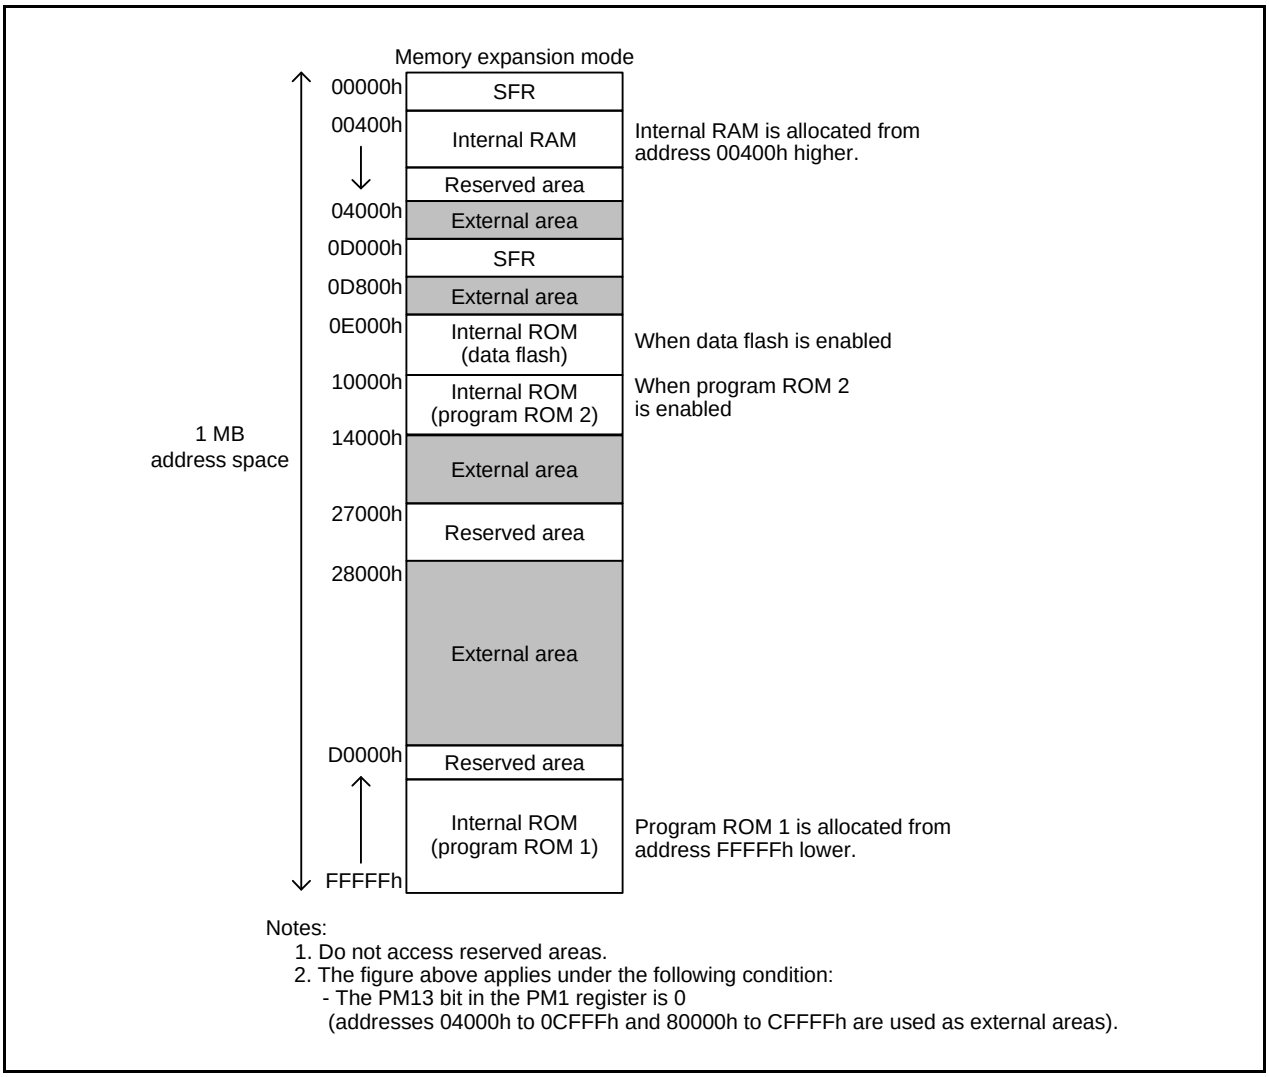

Figure 3.1 Address Space

3.2 Memory Map

Special function registers (SFRs) are allocated from address 00000h to 003FFh and from 0D000h to 0D7FFh. Peripheral function control registers are located here. All blank areas within SFRs are reserved. Do not access these areas.

Internal RAM is allocated from address 00400h and higher, with 10 KB of internal RAM allocated from 00400h to 02BFFh. Internal RAM is used not only for data storage, but also for the stack area when subroutines are called or when an interrupt request is accepted.

The internal ROM is flash memory. Three internal ROM areas are available: data flash, program ROM 1, and program ROM 2.

The data flash is allocated from 0E000h to 0FFFFh. This data flash area is mostly used for data storage, but can also store programs.

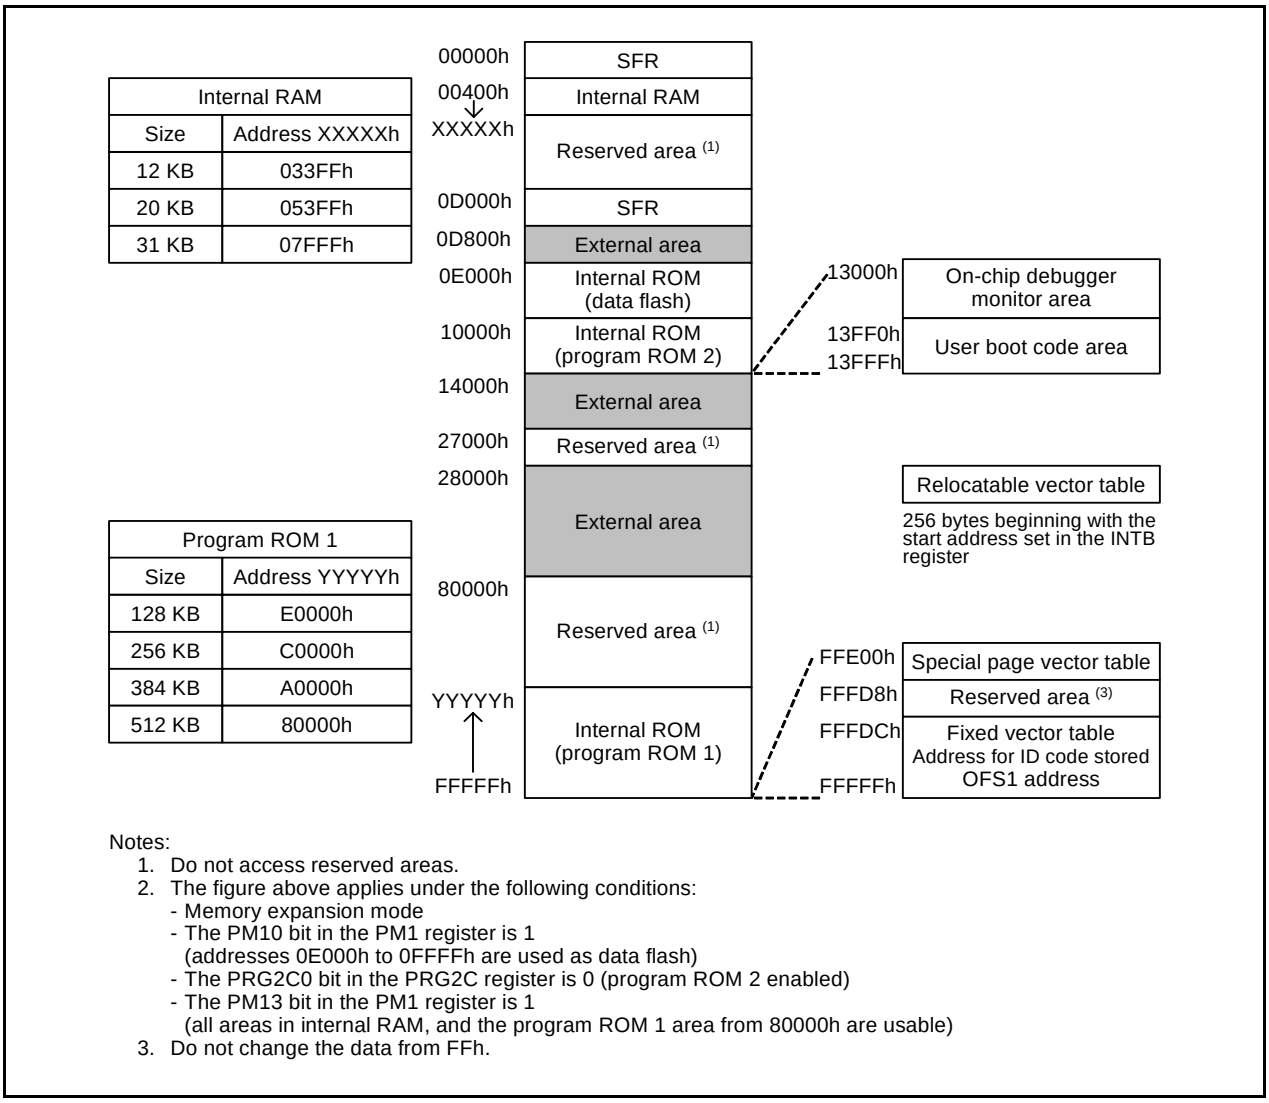
Program ROM 2 is allocated from 10000h to 13FFFh. Program ROM 1 is allocated from FFFFFh and lower, with the 64-KB program ROM 1 area allocated from address F0000h to FFFFFh.

The special page vectors are allocated from FFE00h to FFFD7h. They are used for the JMPS and JSRS instructions. Refer to the M16C/60, M16C/20, M16C/Tiny Series Software Manual for details.

The fixed vector table for interrupts is allocated from FFFDCh to FFFFFh.

The 256 bytes beginning with the start address set in the INTB register compose the relocatable vector table for interrupts.

Figure 3.2 shows the Memory Map.

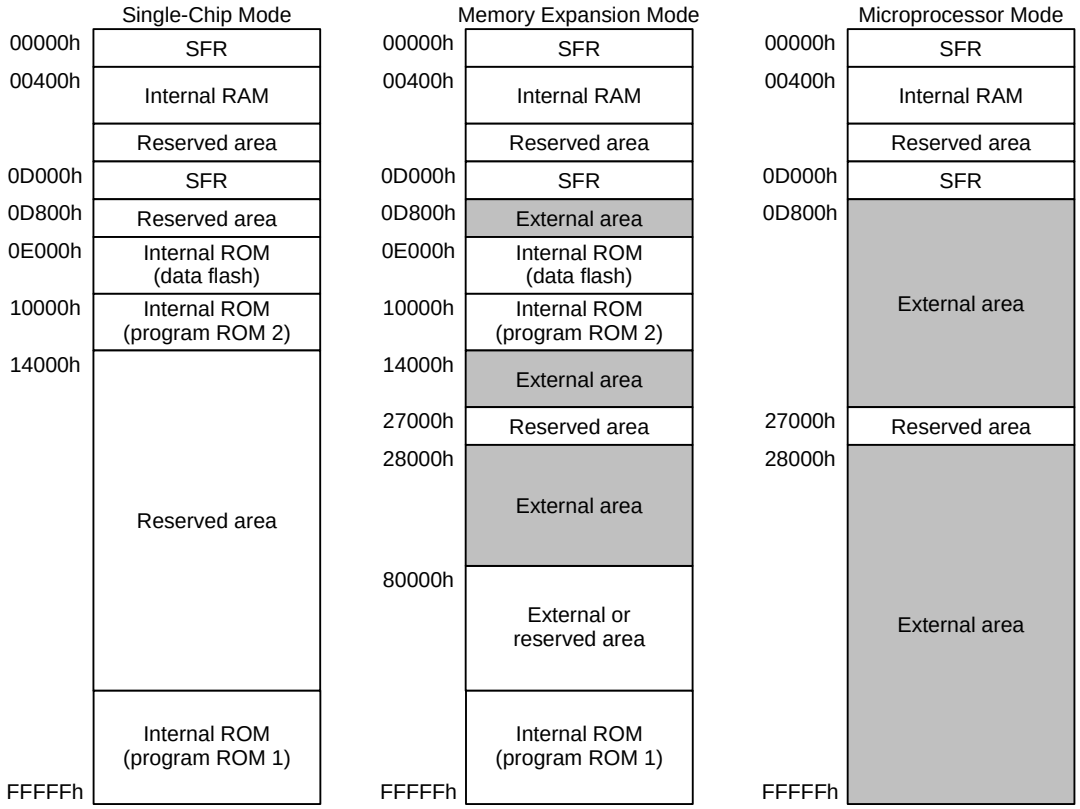


Notes:
1. Do not access reserved areas.
2. The figure above applies under the following conditions:
   - Memory expansion mode
   - The PM10 bit in the PM1 register is 1
     (addresses 0E000h to 0FFFFh are used as data flash)
   - The PRG2C0 bit in the PRG2C register is 0 (program ROM 2 enabled)
   - The PM13 bit in the PM1 register is 1
     (all areas in internal RAM, and the program ROM 1 area from 80000h are usable)
3. Do not change the data from FFh.

Figure 3.2 Memory Map

3.3 Accessible Area in Each Mode

Areas that can be accessed vary depending on processor mode and the status of each control bit. Figure 3.3 shows the Accessible Area in Each Mode.
In single-chip mode, the SFRs, internal RAM, and internal ROM can be accessed.
In memory expansion mode, the SFRs, internal RAM, internal ROM, and external areas can be accessed.
In microprocessor mode, the SFRs, internal RAM, and external areas can be accessed. Allocate ROM to the fixed vector table from FFFDCh to FFFFFh.



Notes:
1. Do not access reserved areas.
2. The figure above applies under the following conditions:
   Single-chip mode and memory expansion mode
   - The PM10 bit in the PM1 register is 1
     (addresses 0E000h to 0FFFFh are used as data flash)
   - The PRG2C0 bit in the PRG2C register is 0 (program ROM 2 enabled)
   - The PM13 bit in the PM1 register is 1
     (all areas in internal RAM, and the program ROM 1 area from 80000h are usable)re usable).

   Microprocessor mode
   - The PM10 bit is 0 (addresses 0E000h to 0FFFFh are used as the $\overline{CS2}$ area).
   - The PRG2C0 bit is 1 (program ROM 2 disabled).

4.2 Notes on SFRs

4.2.1 Register Settings

Table 4.24 lists Registers with Write-Only Bits (1/2) and registers whose function differs between reading and writing. Set these registers with immediate values. Do not use read-modify-write instructions. When establishing the next value by altering the existing value, write the existing value to the RAM as well as to the register. Transfer the next value to the register after making changes in the RAM. Read-modify-write instructions can be used when writing to the no register bits.

Notes:
1. Definition of program and erase cycles:
   The program and erase cycles refer to the number of per-block erasures. If the program and erase cycles are n (n = 1,000), each block can be erased n times. For example, if a block is erased after writing 2 word data 16,384 times, each to a different address, this counts as one program and erase cycles. Data cannot be written to the same address more than once without erasing the block (rewrite prohibited).
2. Cycles to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
3. In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. It is advisable to retain data on the erasure cycles of each block and limit the number of erase operations to a certain number.
4. If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.
5. Customers desiring program/erase failure rate information should contact a Renesas Electronics sales office.
6. The data hold time includes time that the power supply is off or the clock is not supplied.

Notes:
1. Definition of program and erase cycles
   The program and erase cycles refer to the number of per-block erasures.
   If the program and erase cycles are n (n = 10,000), each block can be erased n times.
   For example, if a 4 KB block is erased after writing 2 word data 1,024 times, each to a different address, this counts as one program and erase cycles. Data cannot be written to the same address more than once without erasing the block (rewrite prohibited).
2. Cycles to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
3. In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 256 groups before erasing them all in one operation. In addition, averaging the erasure cycles between blocks A and B can further reduce the actual erasure cycles. It is also advisable to retain data on the erasure cycles of each block and limit the number of erase operations to a certain number.
4. If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.
5. Customers desiring program/erase failure rate information should contact a Renesas Electronics sales office.
6. The data hold time includes time that the power supply is off or the clock is not supplied.

2. Calculated according to the BCLK frequency as follows:

3. This standard value shows the timing when the output is off, and does not show hold time of data bus.
   Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.
   Hold time of data bus is expressed in
   $t = -CR \times \ln(1 - V_{OL}/V_{CC2})$
   by a circuit of the right figure.
   For example, when $V_{OL} = 0.2V_{CC2}$, C = 30 pF, R = 1 kΩ, hold time of output low level is
   $t = -30\ pF \times 1\ k\Omega \times \ln(1 - 0.2V_{CC2}/V_{CC2})$
   = 6.7 ns.

1. Calculated according to the BCLK frequency as follows:

   $\frac{0.5 \times 10^9}{f_{(BCLK)}} - 40[ns]$ $f_{(BCLK)}$ is 12.5 MHz or less.

2. Calculated according to the BCLK frequency as follows:

   $\frac{0.5 \times 10^9}{f_{(BCLK)}} - 10[ns]$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus.
   Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.
   Hold time of data bus is expressed in
   $t = -CR \times \ln(1 - V_{OL}/V_{CC2})$
   by a circuit of the right figure.
   For example, when $V_{OL} = 0.2V_{CC2}$, C = 30 pF, R = 1 kΩ,
   hold time of output low level is
   $t = -30\ pF \times 1\ k\Omega \times \ln(1 - 0.2V_{CC2}/V_{CC2})$
   = 6.7 ns.

General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

1. Handling of Unused Pins

   Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

   — The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

   The state of the product is undefined at the moment when power is supplied.

   — The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

   In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

   In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

   Access to reserved addresses is prohibited.

   — The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

   After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

   — When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

   Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.

   — The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.
