## M37736EBHXXXGP

## M37736EBHGS

PROM VERSION OF M37736MHBXXXGP

### DESCRIPTION

The M37736EBHXXXGP is a single-chip microcomputer using the 7700 Family core. This single-chip microcomputer has a CPU and a bus interface unit. The CPU is a 16-bit parallel processor that can be an 8-bit parallel processor, and the bus interface unit enhances the memory access efficiency to execute instructions fast. This microcomputer also includes a 32 kHz oscillation circuit, in addition to the PROM, RAM, multiple-function timers, serial I/O, A-D converter, and others.

In the M37736EBHXXXGP, as the multiplex method of the external bus, either of 2 types can be selected.

The M37736EBHXXXGP has the same function as the M37736MHBXXXGP except that the built-in ROM is PROM. (Refer to the basic function blocks description.) For program development, the M37736EBHGS with erasable ROM that is housed in a windowed ceramic LCC is also provided.

### FEATURES

- Number of basic instructions ..... 103
- Memory size PROM ..... 124 Kbytes  
RAM ..... 3968 bytes
- Instruction execution time  
The fastest instruction at 25 MHz frequency ..... 160 ns

- Single power supply ..... 5 V ± 10%
- Low power dissipation (at 25 MHz frequency) ..... 47.5 mW (Typ.)
- Interrupts ..... 19 types, 7 levels
- Multiple-function 16-bit timer ..... 5 + 3
- Serial I/O (UART or clock synchronous) ..... 3
- 10-bit A-D converter ..... 8-channel inputs
- 12-bit watchdog timer
- Programmable input/output, output (ports P0, P1, P2, P3, P4, P5, P6, P7, P8, P9, P10) ..... 84
- Clock generating circuit ..... 2 circuits built-in

### APPLICATION

Control devices for general commercial equipment such as office automation, office equipment, and others.

Control devices for general industrial equipment such as communication equipment, and others.

**Note.** Do not use the windowed EPROM version for mass production, because it is a tool for program development (for evaluation).

**PIN DESCRIPTION**

Pin	Name	Input/Output	Functions
Vcc, Vss	Power source		Apply 5 V ± 10% to Vcc and 0 V to Vss.
CNVss	CNVss input	Input	This pin controls the processor mode. Connect to Vss for the single-chip mode and the memory expansion mode, and to Vcc for the microprocessor mode.
RESET	Reset input	Input	When "L" level is applied to this pin, the microcomputer enters the reset state.
XIN	Clock input	Input	These are pins of main-clock generating circuit. Connect a ceramic resonator or a quartz-crystal oscillator between XIN and XOUT. When an external clock is used, the clock source should be connected to the XIN pin, and the XOUT pin should be left open.
XOUT	Clock output	Output	
E	Enable output	Output	This pin functions as the enable signal output pin which indicates the access status in the internal bus. In the external bus mode B and the memory expansion mode or the microprocessor mode, this pin output signal RDE.
BYTE	External data bus width selection input	Input	In the memory expansion mode or the microprocessor mode, this pin determines whether the external data bus has an 8-bit width or a 16-bit width. The data bus has a 16-bit width when "L" signal is input and an 8-bit width when "H" signal is input.
BSEL	Bus method select input	Input	In the memory expansion mode or the microprocessor mode, this pin determines the external bus mode. The bus mode becomes the external bus mode A when "H" signal is input, and the external bus mode B when "L" signal is input.
AVcc, AVss	Analog power source input		Power source input pin for the A-D converter. Externally connect AVcc to Vcc and AVss to Vss.
VREF	Reference voltage input	Input	This is reference voltage input pin for the A-D converter.
P00 – P07	I/O port P0	I/O	In the single-chip mode, port P0 becomes an 8-bit I/O port. An I/O direction register is available so that each pin can be programmed for input or output. These ports are in the input mode when reset. In the memory expansion mode or the microprocessor mode, these pins output address (A0 – A7) at the external bus mode A, and these pins output signals CS0 – CS4 and RSMP, and addresses (A16, A17) at the external bus mode B.
P10 – P17	I/O port P1	I/O	In the single-chip mode, these pins have the same functions as port P0. When the BYTE pin is set to "L" in the memory expansion mode or the microprocessor mode and external data bus has a 16-bit width, high-order data (D8 – D15) is input/output or an address (A8 – A15) is output. When the BYTE pin is "H" and an external data bus has an 8-bit width, only address (A8 – A15) is output.
P20 – P27	I/O port P2	I/O	In the single-chip mode, these pins have the same functions as port P0. In the memory expansion mode or the microprocessor mode, low-order data (D0 – D7) is input/output or an address is output. When using the external bus mode A, the address is A16 – A23. When using the external bus mode B, the address is A0 – A7.
P30 – P33	I/O port P3	I/O	In the single-chip mode, these pins have the same function as port P0. In the memory expansion mode or the microprocessor mode, R/W, BHE, ALE, and HLDA signals are output at the external bus mode A, and WEL, WEH, ALE, and HLDA signals are output at the external bus mode B.
P40 – P47	I/O port P4	I/O	In the single-chip mode, these pins have the same functions as port P0. In the memory expansion mode or the microprocessor mode, P40, P41 and P42 become HOLD and RDY input pins, and a clock φ1 output pin, respectively. Functions of the other pins are the same as in the single-chip mode. However, in the memory expansion mode, P42 can be selected as an I/O port.
P50 – P57	I/O port P5	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins also function as I/O pins for timers A0 to A3.
P60 – P67	I/O port P6	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins also function as I/O pins for timer A4, input pins for external interrupt input (INT0 – INT2) and input pins for timers B0 to B2. P67 also functions as sub-clock φSUB output pin.
P70 – P77	I/O port P7	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins function as input pins for A-D converter. Additionally, P76 and P77 have the function as the output pin (XcOUT) and the input pin (XcIN) of the sub-clock (32 kHz) oscillation circuit, respectively. When P76 and P77 are used as the XcOUT and XcIN pins, connect a resonator or an oscillator between the both.
P80 – P87	I/O port P8	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins also function as I/O pins for UART 0 and UART 1.
P90 – P97	Output port P9	Output	Port P9 is an 8-bit I/O port. These ports are floating when reset. When writing to the port latch, these ports become the output mode. P90 – P93 also function as I/O port for UART 2.
P100 – P107	I/O port P10	I/O	In addition to having the same functions as port P0 in the single-chip mode, P104 – P107 also function as input pins for key input interrupt input (KI0 – KI3).
EVL0, EVL1	—	Output	These pins should be left open.

 Some parametric limits are subject to change.

**BASIC FUNCTION BLOCKS**

The M37736EBXXXGP has the same function as the M37736MHBXXXGP except that the built-in ROM is PROM. Refer to the section on the M37736MHBXXXGP.

**PIN DESCRIPTION (EPROM MODE)**

Pin	Name	Input/Output	Functions
VCC, VSS	Power supply		Supply 5V±10% to VCC and 0V to VSS.
CNVSS	VPP input	Input	Connect to VPP when programming or verifying.
BYTE	VPP input	Input	Connect to VPP when programming or verifying.
RESET	Reset input	Input	Connect to VSS.
XIN	Clock input	Input	Connect a ceramic resonator between XIN and XOUT.
XOUT	Clock output	Output	
E	Enable output	Output	Keep open.
AVCC, AVSS	Analog supply input		Connect AVCC to VCC and AVSS to VSS.
VREF	Reference voltage input	Input	Connect to VSS.
P00 – P07	Address input (A0 – A7)	Input	Port P0 functions as the lower 8 bits address input (A0 – A7).
P10 – P17	Address input (A8 – A15)	Input	Port P1 functions as the higher 8 bits address input (A8 – A15).
P20 – P27	Data I/O (D0 – D7)	I/O	Port P2 functions as the 8 bits data input/output (D0 – D7).
P30	Address input (A16)	Input	P30 functions as the most significant bit address input (A16).
P31 – P33	Input port P3	Input	Connect to VSS.
P40 – P47	Input port P4	Input	Connect to VSS.
P50 – P57	Control signal input	Input	P50, P51, and P52 function as PGM, OE, and CE input pins respectively. Connect P53, P54, P55, and P56 to Vcc. Connect P57 to VSS.
P60 – P67	Input port P6	Input	Connect to VSS.
P70 – P77	Input port P7	Input	Connect to VSS.
P80 – P87	Input port P8	Input	Connect to VSS.
P90 – P97	Input port P9	Input	Connect to VSS.
P100 – P107	Input port P10	Input	Connect to VSS.
BSEL	_____	Input	Connect to VCC.
EVL0, EVL1	_____	Output	Keep open.

PROM VERSION OF M37736MHBXXXGP

**EPROM MODE**

The M37736EHBXXXGP features an EPROM mode in addition to its normal modes. When the RESET signal level is "L", the chip automatically enters the EPROM mode. Table 1 list the correspondence between pins and Figure 1 shows the pin connections in the EPROM mode.

The EPROM mode is the 1M mode for the EPROM that is equivalent to the M5M27C101K.

When in the EPROM mode, ports P0, P1, P2, P30, P50, P51, P52, CNVss, and BYTE are used for the EPROM (equivalent to the M5M27C101K).

When in this mode, the built-in PROM can be programmed or read from using these pins in the same way as with the M5M27C101K.

This chip does not have Device Identifier Mode, so that set the corresponding program algorithm. The program area should specify address 0100016 – 1FFFF16.

Connect the clock which is either ceramic resonator or external clock to XIN pin and XOUT pin.

**FUNCTION IN EPROM MODE**  
**1M mode (equivalent to the M5M27C101K)**

**Reading**

To read the EPROM, set the  $\overline{CE}$  and  $\overline{OE}$  pins to a "L" level. Input the address of the data (A0 – A16) to be read, and the data will be output to the I/O pins D0 – D7. The data I/O pins will be floating when either the  $\overline{CE}$  or  $\overline{OE}$  pins are in the "H" state.

**Programming**

Programming must be performed in 8 bits by a byte program. To program to the EPROM, set the  $\overline{CE}$  pin to a "L" level and the  $\overline{OE}$  pin to a "H" level. The CPU will enter the programming mode when 12.5 V is applied to the VPP pin. The address to be programmed to is selected with pins A0 – A16, and the data to be programmed is input to pins D0 – D7. Set the PGM pin to a "L" level to being programming.

**Erasing**

To erase data on this chip, use an ultraviolet light source with a 2537 Angstrom wave length. The minimum radiation power necessary for erasing is 15 J/cm<sup>2</sup>.

**Programming operation**

To program the M37733EHBXXXFP, first set VCC = 6 V, VPP = 12.5 V, and set the address to 01000<sub>16</sub>. Apply a 0.2 ms programming pulse, check that the data can be read, and if it cannot be read OK, repeat the procedure, applying a 0.2 ms programming pulse and checking that the data can be read until it can be read OK. Record the accumulated number of pulse applied (X) before the data can be read OK, and then write the data again, applying a further once this number of pulses (0.2 X X ms).

When this series of programming operations is complete, increment the address, and continue to repeat the procedure above until the last address has been reached.

Finally, when all addresses have been programmed, read with VCC = VPP = 5 V (or VCC = VPP = 5.5 V).

**SAFETY INSTRUCTIONS**

- (1) Sunlight and fluorescent lamp contain light that can erase written information. When using in read mode, be sure to cover the transparent glass portion with a seal or other materials (ceramic package product).
- (2) Mitsubishi Electric corp. provides the seal for covering the transparent glass. Take care that the seal does not touch the read pins (ceramic package product).
- (3) Clean the transparent glass before erasing. Fingers' fat and paste disturb the passage of ultraviolet rays and may affect badly the erasure capability (ceramic package product).
- (4) A high voltage is used for programming. Take care that over-voltage is not applied. Take care especially at power on.
- (5) The programmable M37736EBBGP that is shipped in blank is also provided. For the M37736EBBGP, Mitsubishi Electric corp. does not perform PROM programming test and screening following the assembly processes. To improve reliability after programming, performing programming and test according to the flow below before use is recommended.

**ADDRESSING MODES**

The M37736EBXXXXGP has 28 powerful addressing modes. Refer to the "7700 Family Software Manual" for the details.

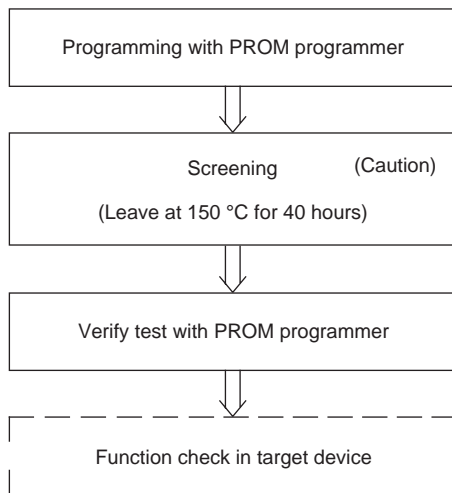

**MACHINE INSTRUCTION LIST**

The M37736EBXXXXGP has 103 machine instructions. Refer to the "7700 Family Software Manual" for the details.

**DATA REQUIRED FOR PROM ORDERING**

Please send the following data for writing to PROM.

- (1) M37736EBXXXXGP writing to PROM order confirmation form
- (2) 100P6S mark specification form
- (3) ROM data (EPROM 3 sets)

Caution : Never expose to 150 °C exceeding 100 hours.

**PACKAGE OUTLINE**

**Keep safety first in your circuit designs!**

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

**Notes regarding these materials**

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination. Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
