

# Rail-to-Rail Operational Amplifier

## General Description

The RT9137/RT9138/RT9139 consist low power, high slew rates, rail-to-rail input and output operation amplifiers.

The RT9137 contains a single amplifier, RT9138 contains two amplifiers and RT9139 contains four amplifiers in one package.

The RT9137/RT9138/RT9139 have high slew rates (120V/μs), 35mA continuous output current, 300mA peak output current and offset voltage below 16.5mV.

The RT9137 is available in TSOT-23-5 and WDFN-6L 2x2 packages. The RT9138 is available in MSOP-8 and WDFN-6L 2x2 packages. The RT9139 is available in WQFN-16L 4x4, TSSOP-14, TSSOP-14 (Exposed Pad), MSOP-10 and WDFN-10L 3x3 package.

The RT9137/RT9138/RT9139 are specified for operation over the full -40°C to 85°C temperature range.

## Features

- Rail-to-Rail Output Swing
- Supply Voltage : 4.5V to 16.5V
- Continuous Output Current : 35mA
- Peak Output Current : 300mA
- High Slew Rate : 120V/μs
- RoHS Compliant and Halogen Free

## Applications

- Notebook Computer Displays
- LCD Monitor Panels
- Automotive Displays
- LCD-TVs

## Ordering Information

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

**Note 1.** Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

**Note 2.** θ<sub>JA</sub> is measured in the natural convection at T<sub>A</sub> = 25°C on a high effective thermal conductivity four-layer test board of JEDEC 51-7 thermal measurement standard.

**Note 3.** Devices are ESD sensitive. Handling precaution is recommended.

**Note 4.** The device is not guaranteed to function outside its operating conditions.

## Application Information

The RT9137/RT9138/RT9139 is a high performance operational amplifier capable of driving large loads for different applications. A high slew rate, rail-to-rail input and output capability, and low power consumption are the features which make the operational amplifier ideal for LCD applications. The RT9137/RT9138/RT9139 also has wide bandwidth and phase margin to drive a panel load.

### Operating Voltage

The RT9137/8/9 is specified with a single nominal supply voltage from 5V to 15V or a split supply with its total range from 5V to 15V. Correct operation is guaranteed for a supply range of 4.5V to 16.5V. The RT9137/8/9 specifications remain stable over the entire supply range and operating temperature range from -40°C to 85°C. Parameter variations with operating voltage and temperature are shown in the typical performance curves. The output swing of the RT9137/8/9 typically extends to within 80mV of positive/negative supply rails with 5mA load current source/sink.

### Short Circuit Condition

An internal short circuit protection circuit is implemented to protect the device from output short circuit. The RT9137/8/9 limits the short circuit current to ±300mA when supply voltage is ±7.5V. For reliability concerns, a continuous output current of not more than ±35mA is recommended.

### Unused Amplifier

If the amplifier is unused, it is recommended to connect the positive input to ground while keeping the output pin open.

### Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating condition specifications of the RT9137/8/9, the maximum junction temperature is 125°C and  $T_A$  is the ambient temperature. The junction to ambient thermal resistance,  $\theta_{JA}$ , is layout dependent. The thermal resistance,  $\theta_{JA}$ , is 160°C/W for TSOT-23-5 package, 120°C/W for WDFN-6L 2x2 package, 120°C/W for MSOP-8 package, 50°C/W for TSSOP-14 (Exposed Pad) package, 120°C/W for TSSOP-14 package, 54°C/W for WQFN-16L 4x4 package, 120°C/W for MSOP-10 package, and 70°C/W for WDFN-10L 3x3 package, on a standard JEDEC 51-7 four-layer thermal test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated by the following formulas :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (160^\circ\text{C/W}) = 0.625\text{W for TSOT-23-5 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (120^\circ\text{C/W}) = 0.833\text{W for WDFN-6L 2x2 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (120^\circ\text{C/W}) = 0.833\text{W for MSOP-8 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (50^\circ\text{C/W}) = 2\text{W for TSSOP-14 (Exposed Pad) package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (120^\circ\text{C/W}) = 0.833\text{W for TSSOP-14 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (54^\circ\text{C/W}) = 1.852\text{W for WQFN-16L 4x4 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (120^\circ\text{C/W}) = 0.833\text{W for MSOP-10 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (70^\circ\text{C/W}) = 1.429\text{W for WDFN-10L 3x3 package}$$

The maximum power dissipation depends on the operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance,  $\theta_{JA}$ . For the RT9137/8/9 packages, the derating curves in Figure 1 allow the designer to see the effect of rising ambient temperature on the maximum power dissipation.

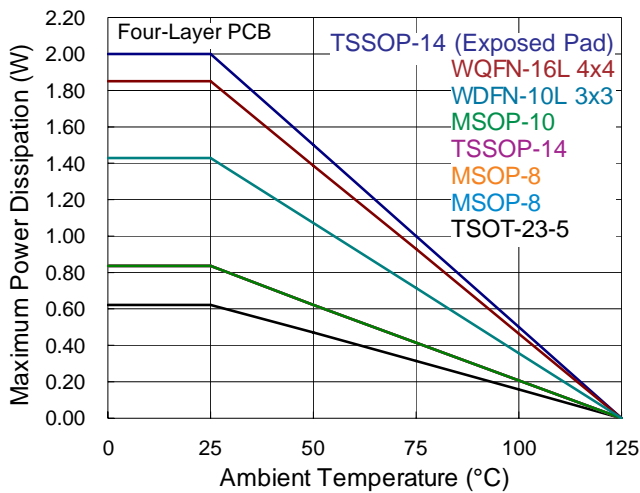

Figure 1. Derating Curves for the RT9137/8/9 Packages

**Layout Considerations**

PCB layout is very important for designing power circuits. The following layout guidelines should be strictly followed for best performance of the RT9137/8/9.

- ▶ Place the components as close to the IC as possible. The traces should be wide and short, especially for the high current loop.
- ▶ Connect a 0.1μF capacitor from VIN+ to ground and place it as close to the IC as possible for better performance.
- ▶ A series resistance may be needed at the output for some applications.
- ▶ The exposed pad of the chip should be connected to a strong ground or VS- plane for maximum thermal consideration.
