DG409/883

Single 8-Channel/Differential 4-Channel CMOS Analog Multiplexers

June 1994

Features

- **This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.**
- **ON-Resistance 100Ω Maximum (+25°C)**
- **Low Power Consumption (P_D <11mW)**
- **Fast Switching Action**
  - **t_{TRANS} <250ns**
  - **$t_{ON/OFF(EN)}$ <150ns**
- **Low Charge Injection**
- **Upgrade from DG508A/DG509A**
- **TTL, CMOS Compatible**
- **Single or Split Supply Operation**

Applications

- **Data Acquisition Systems**
- **Audio Switching Systems**
- **Automatic Testers**
- **Hi-Rel Systems**
- **Sample and Hold Circuits**
- **Communication Systems**
- **Analog Selector Switch**

Description

The DG408/883 Single 8-Channel and DG409/883 Differential 4-Channel monolithic CMOS analog multiplexers are drop-in replacements for the popular DG508A and DG509A series devices. They each include an array of eight analog switches, a TTL/CMOS compatible digital decode circuit for channel selection, a voltage reference for logic thresholds and an ENABLE input for device selection when several multiplexers are present.

The DG408/883 and DG409/883 feature lower signal ON resistance (<100Ω) and faster switch transition time (t_{TRANS} <250ns) compared to the DG508A or DG509A. Charge injection has been reduced, simplifying sample and hold applications. The improvements in the DG408/883 series are made possible by using a high-voltage silicon-gate process. An epitaxial layer prevents the latch-up associated with older CMOS technologies. Power supplies may be single-ended from +5V to +34V, or split from ±5V to ±20V.

The analog switches are bilateral, equally matched for AC or bidirectional signals. The ON resistance variation with analog signals is quite low over a ±5V analog input range.
