PRODUCT OVERVIEW

S3C8-SERIES MICROCONTROLLERS

Samsung's S3C8-series of 8-bit single-chip CMOS microcontrollers offers a fast and efficient CPU, a wide range of integrated peripherals and various mask-programmable ROM sizes. Important CPU features include:

- Efficient register-oriented architecture
- Selectable CPU clock sources
- Idle and Stop power-down mode release by interrupt
- Built-in basic timer with watchdog function

A sophisticated interrupt structure recognizes up to eight interrupt levels. Each level can have one or more interrupt sources and vectors. Fast interrupt processing (within a minimum six CPU clocks) can be assigned to specific interrupt levels.

S3C80E5/C80E7 MICROCONTROLLER

The S3C80E5/C80E7 single-chip CMOS microcontroller is fabricated using a highly advanced CMOS process, based on Samsung's newest CPU architecture.

The S3C80E5/C80E7 is the microcontroller which has 16/24-Kbyte mask-programmable ROM. The S3P80E5/P80E7 is the microcontroller which has 16/24-Kbyte one-time-programmable EPROM.

Using a proven modular design approach, Samsung engineers developed the S3C80E5/C80E7 by integrating the following peripheral modules with the powerful SAM87 core:

- Four programmable I/O ports, including three 8-bit ports and one 2-bit port, for a total of 26 pins.

OTP

The S3P80E5/P80E7 is an OTP (One Time Programmable) version of the S3C80E5/C80E7 microcontroller. The S3P80E5/P80E7 microcontroller has an on-chip 16/24-Kbyte one-time-programmable EPROM instead of a masked ROM. The S3P80E5/P80E7 is comparable to the S3C80E5/C80E7, both in function and in pin configuration.

- Internal LVD circuit and twelve bit-programmable pins for external interrupts.
- One 8-bit basic timer for oscillation stabilization and watchdog functions (system reset).
- One 8-bit timer/counter and one 16-bit timer/counter with selectable operating modes.
- One 8-bit counter with auto-reload function and one-shot or repeat control.

The S3C80E5/C80E7 is a versatile general-purpose microcontroller which is especially suitable for use as unified remote transmitter controller. It is currently available in a 32-pin SOP and SDIP package for S3C80E5 and S3C80E7. And available in 40 DIP package only for S3C80E7.

PIN CIRCUITS

NOTE: To prevent and recover from abnormal stop status caused by battery bouncing, the S3P80E5 has a special logic_{SED} and R circuit –related to P0 and P1. This is a specific function for key input/output of universal remote controller. When these ports (P0, P1) are used as a normal input pin, unexpected stop mode recovery can occur by input level switching. Hence, the user should be aware of input level switching, if P0 and P1 are to be used as normal input ports.

S3P80E5/P80E7 OTP

OVERVIEW

The S3P80E5/P80E7 single-chip CMOS microcontroller is the OTP (One Time Programmable) version of the S3C80E5/C80E7 microcontroller. It has an on-chip EPROM instead of a masked ROM.

The S3P80E5/P80E7 is fully compatible with the S3C80E5/C80E7, both in function and in pin configuration. Because of its simple programming requirements, the S3P80E5/P80E7 is ideal as an evaluation chip for the S3C80E5/C80E7.
